Thorlabs Confidential Page 7 of 234

Introduction

1. Purpose and Scope

This document describes the low-level communications protocol and commands used between the host PC and controller units within the APT family. The information contained in this document is intended to help third party system developers to write their own applications to interface to the Thorlabs range of controllers without the constraints of using a particular operating system or hardware platform. The commands described here are those which are necessary to control movement; there is an additional set of commands, used for calibration or test, which will not be detailed as these are not required for the external system developer.

2. Electrical interface

The APT family of controllers provides a USB and an RS-232 interface to communicate with the host PC. The communications protocol is identical in both cases but developers wishing to use the USB interface should be aware of the USB enumeration scheme used in the system.

2.1 USB Interface

The electrical interface within the APT controllers uses a Future Technology Devices International (FTDI), type FT232BM USB peripheral chip to communicate with the host PC. This is a USB2.0 compliant USB1.1 device. This USB interfacing chip provides a serial port interface to the embedded system (i.e. APT controller) and USB interface to the host control PC. While the overall communications protocol is independent of the transport layer (for example, Ethernet or serial communications could also be used to carry commands from the host to the controller), the initial enumeration scheme described below is specific to the USB environment.

FTDI supply device drivers and interfacing libraries (for Windows, Linux and other platforms) used to access the USB chip. Before any PC USB communication can be established with an APT controller, the client program is required to set up the necessary FTDI chip serial port settings used to communicate to the APT controller embedded system. Within the APT software itself the following FTDI library calls are made to set up the USB chip serial port for each APT USB device enumerated on the bus:-

```
// Set baud rate to 115200.
ftStatus = FT_SetBaudRate(m_hFTDevice, (ULONG)uBaudRate);

// 8 data bits, 1 stop bit, no parity
ftStatus = FT_SetDataCharacteristics(m_hFTDevice, FT_BITS_8, FT_STOP_BITS_1,
FT_PARITY_NONE);

// Pre purge dwell 50ms.
Sleep(uPrePurgeDwell);

// Purge the device.
ftStatus = FT_Purge(m_hFTDevice, FT_PURGE_RX | FT_PURGE_TX);

// Post purge dwell 50ms.
Sleep(uPostPurgeDwell);
```

Thorlabs Confidential Page 8 of 234

```
// Reset device.
ftStatus = FT_ResetDevice(m_hFTDevice);

// Set flow control to RTS/CTS.
ftStatus = FT_SetFlowControl(m_hFTDevice, FT_FLOW_RTS_CTS, 0, 0);

// Set RTS.
ftStatus = FT_SetRts(m_hFTDevice);
```

2.2 USB Device Enumeration

The APT Server PC software supplied is designed to work with a number of different types of controller. The purpose of the enumeration phase is for the host to establish what devices are present in the system and initialise the GUI accordingly. Initially this is done by enumerating the USB devices connected to the system and reading the serial number information contained in the USB device descriptor.

For the Thorlabs range of controllers, this serial number is an 8-digit decimal number. The first two digits (referred to as the prefix) describe the type of controller, while the rest of the digits make up a unique serial number. By extracting the prefix, the host can therefore establish what type of hardware is connected to the system.

In most cases, specifically with benchtop controllers, the USB serial number contains sufficient information for the host to know the exact type of hardware is connected. There is a range of other controller products where several controller cards (without their own individual USB peripheral chip) can be plugged into a motherboard and it is only the motherboard that has USB connectivity. These are generally referred to as a card slot (or bay) type of system (for example, the BSC103 controller). In these systems, a second enumeration state is carried out; however, this second state is done within the protocol framework that will be detailed in this document.

For the controller types, the USB prefixes can be the following:

USB S/N	Type of product	Thorlabs code	
20xxxxxx	Legacy single channel stepper driver	BSC001	
25xxxxxx	Legacy single channel mini stepper driv	er BMS001	
30xxxxxx	Legacy dual channel stepper driver	BSC002	
35xxxxxx	Legacy dual channel mini stepper drive	r BMS002	
40xxxxxx	Single channel stepper driver	BSC101	
60xxxxxx	OptoSTDriver (mini stepper driver)	OST001	
63xxxxxx	OptoDCDriver (mini DC servo driver)	ODC001	
70xxxxxx	Three channel card slot stepper driver	BSC103	
80xxxxxx	Stepper Driver T-Cube	TST001	
83xxxxxx	DC servo driver T-Cube	TDC001	
73xxxxxx	Brushless DC motherboard	BBD102/BBD103	
94xxxxxx	Brushless DC motor card	BBD102/BBD103	

Of these listed above, currently only the BSC103 (serial number prefix 70) and the BBD10x are card slot type of controllers.

Thorlabs Confidential Page 9 of 234

2.3 RS-232 Interface

The RS-232 interface uses the 9-way D-Type male connector on the rear panel, marked 'INTERCONNECT'. Communications parameters are fixed at:

- 115200 bits/sec
- 8 data bits, 1 stop bit
- No parity
- No handshake

By nature, the RS-232 interface provides point-to-point communications, and therefore there is no device enumeration as there is with USB based communications.

3. Overview of the Communications Protocol

The communications protocol used in the Thorlabs controllers is based on the message structure that always starts with a fixed length, 6-byte *message header* which, in some cases, is followed by a variable length *data packet*. For simple commands, the 6-byte message header is sufficient to convey the entire command. For more complex commands, for example, when a set of parameters needs to be passed on, the 6 byte header is not enough and in this case the header is followed by the data packet.

The header part of the message always contains information that indicates whether or not a data packet follows the header and if so, the number of bytes that the data packet contains. In this way the receiving process is able to keep tracks of the beginning and the end of messages.

Note that in the section below describing the various byte sequences, the C-type of notation will be used for hexadecimal values (e.g. 0x55 means 55 hexadecimal) and logical operators (e.g. | means logic bitwise OR). Values that are longer than a byte follow the Intel little-endian format.

4. Description of the message header

The 6 bytes in the message header are shown below:

Byte:
Meaning if no data
packet to follow
Meaning if data packet
to follow

byte 0	byte 1	byte 2	byte 3	byte 4	byte 5
message	ID	param1	param2	dest	source
message	ID	data pack	et length	dest 0x80	source

The meaning of some of the fields depends on whether or not the message is followed by a data packet. This is indicated by the most significant bit in byte 4, called the destination byte, therefore the receiving process must first check if the MSB of byte 4 is set.

If this bit is not set, then the message is a header-only message and the interpretation of the bytes is as follows:

message ID: describes what the action the message requests

param1: first parameter (if the command requires a parameter, otherwise 0)

Thorlabs Confidential Page 10 of 234

param2: second parameter (if the command requires a parameter, otherwise 0)

dest: the destination module source: the source of the message

The meaning of the source and destination bytes will be detailed later. If the MSB of byte 4 is set, then the message will be followed by a data packet and the interpretation of the header is the following:

message ID: describes what the action the message requests

datapacket length: number of bytes to follow after header

Note: although this is a 2-byte long field, currently no datapacket

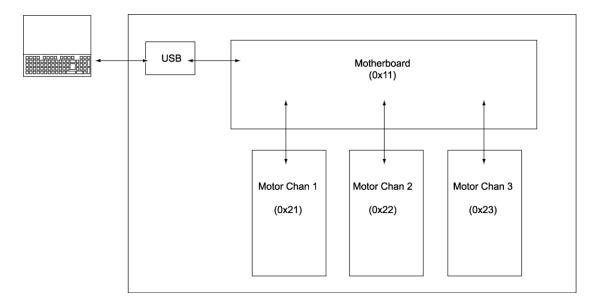

exceeds 255 bytes in length.

dest: | 0x80 the destination module logic OR'd with 0x80 (noted by d|)

source: the source of the data

The source and destination fields require some further explanation. In general, as the name suggests, they are used to indicate the source and destination of the message. In non-card-slot type of systems the source and destination of messages is always unambiguous, as each module appears as a separate USB node in the system. In these systems, when the host sends a message to the module, it uses the source identification byte of 0x01 (meaning host) and the destination byte of 0x50 (meaning "generic USB unit"). (In messages that the module sends back to the host, the content of the source and destination bytes is swapped.)

In card-slot (bay) type of systems, there is only one USB node for a number of sub-modules, so this simple scheme cannot be used. Instead, the host sends a message to the motherboard that the sub-modules are plugged into, with the destination field of each message indicating which *slot* the message must be routed to. Likewise, when the host receives a message from a particular sub-module, it knows from the source byte which slot is the origin of the message – see Fig below.

Thorlabs Confidential Page 11 of 234

Numerically, the following values are currently used for the source and destination bytes:

```
0x01
            Host controller (i.e control PC)
0x11
          Rack controller, motherboard in a card slot system or
           comms router board
0x21
          Bay 0 in a card slot system
0x21
0x22
          Bay 1 in a card slot system
0x23
           etc.
0x24
           etc.
0x25
           etc.
0x26
           etc.
0x2A Bay 9 in a card slot system 0x50 Generic USB hardware unit
```

In slot-type systems the host can also send messages to the motherboard that the submodules are plugged into (destination byte = 0x11). In fact, as a very first step in the communications process, the host must send a message to the motherboard to find out which slots are used in the system.

Note that although in theory this scheme would allow communication between individual sub-modules (the source of the message could be a sub-module and the destination another one), current systems do not use this option.

Thorlabs Confidential Page 12 of 234

5. General message exchange rules

The type of messages used in the communications exchange between the host and the sub-modules can be divided into 4 general categories:

(a) Host issues a command, sub-module carries out the command without acknowledgement (i.e. no response is sent back to the host).

Typically, these are commands which require no information from the sub-module, for example setting the digital outputs to a particular state.

(b) Host issues a command (message request) and the sub-module responds by sending data back to the host.

For example, the host may request the sub-module to report the state of the digital inputs.

(c) Following a command from the host, the sub-module periodically sends a message to the host without further prompting.

These messages are referred to as *status update messages*. These are typically sent automatically every 100 msec from the sub-module to the host, showing, amongst other things, the position of the stage the controller is connected to. The meters on the APT User GUI rely on these messages to show the up-to-date status of the stage.

(d) Rarely – error messages, exceptions. These are spontaneously issued by the sub-module if some error occurs. For example, if the power supply fails in the sub-module, a message is sent to the host PC to inform the user.

Apart from the last two categories (status update messages and error messages), in general the message exchanges follow the SET -> REQUEST -> GET pattern, i.e. for most commands a trio of messages are defined. The SET part of the trio is used by the host (or, sometimes in card-slot systems the motherboard) to set some parameter or other. If then the host requires some information from the sub-module, then it may send a REQUEST for this information, and the sub-module responds with the GET part of the command. Obviously, there are cases when this general scheme does not apply and some part of this message trio is not defined. For consistency, in the description of the messages this SET->REQUEST->GET scheme will be used throughout.

Note that, as the scheme suggests, this is a master-slave type of system, so sub-modules never send SET and REQUEST messages to the host and GET messages are always sent to the host as a destination.

In all messages, where a parameter is longer than a single character, the bytes are encoded in the Intel format, least significant byte first.

Thorlabs Confidential Page 13 of 234

6. Format Specifiers

format	encoding
word	Unsigned 16 bit integer (2 bytes) in the Intel (big-endian) format
	for example decimal 12345 (3039H) is encoded as the byte sequence 39, 30
short	Signed 16 bit integer (2 bytes) in 2's compliment format
	for example decimal -1 is encoded as the byte sequence FF, FF
dword	Unsigned 32 bit integer (4 bytes) in the Intel (big-endian) format
	for example decimal 123456789 (75BCD15H) is encoded as the byte
	sequence 15, CD, 5B, 07
long	Signed 32 bit integer (4 bytes) in 2's compliment format
	for example decimal -1 is encoded as the byte sequence FF, FF
	4 bytes in the Intel (big-endian) format
	for example decimal -123456789 (FFFFFFFF8A432EBH) is encoded as the
	byte sequence EB, 32, A4, F8, FF, FF, FF
char	1 byte (2 digits)
char[N]	string of N characters

7. Single Precision Floating Point Format

Single-precision floating-point format is a computer number format that occupies 4 bytes (32 bits) in computer memory and represents a wide dynamic range of values by using a floating point.

Where message parameters use floating point variables, the system uses the IEEE 754 standard.

8. Conversion between position, velocity and acceleration values in standard physical units and their equivalent APT parameters.

To convert between the position and encoder counters in the stage being driven, and real world units, (e.g. mm) the system uses certain conversion (scaling) factors. These conversion factors differ depending on the stage being driven and the controller being used.

Background

The principle described below is the same for all APT motion stepper and brushed or brushless DC controllers and stages, but the individual distance and time conversion factors will be typically different for each stage and/or controller.

In real life, the physical units needed to describe position, velocity and acceleration are related to position and time measurement units (millimetres/degrees and seconds). In motion controllers, however, normally the system only knows the distance travelled in encoder counts (pulses) as measured by an encoder fitted to the motor shaft. In most cases the motor shaft rotation is also scaled down further by a gearbox and a leadscrew. In any case, the result is a scaling factor between encoder counts and position. The value of this scaling factor depends on the stage. In the section below this scaling factor will be represented by the symbol EncCnt.

Time is related to the sampling interval of the system, and as a result, it depends on the motion controller. Therefore, this value is the same for all stages driven by a particular controller. In the sections below the sampling interval will be denoted by T.

The sections below describe the position, velocity and acceleration scaling factors for all the controllers and stages that are used with these controllers. The symbols POS_{APT} , VEL_{APT} and ACC_{APT} are used to denote the position, velocity and acceleration values used in APT commands, whereas the symbols Pos, Vel and Acc denote physical position, velocity and

Thorlabs Confidential Page 14 of 234

acceleration values in mm, mm/sec and mm/sec² units for linear stages and degree, degree/sec and degree/sec² for rotational stages.

As APT parameters are integer values, the APT values calculated from the equations need to be rounded to the nearest integer.

Brushed DC Controller (TDC001) driven stages

Mathematically:

 $POS_{APT} = EncCnt \times Pos$

 $VEL_{APT} = EncCnt \times T \times 65536 \times Vel$

 $ACC_{APT} = EncCnt \times T^2 \times 65536 \times Acc$

where $T = 2048 / 6 \times 10^6$

The value of EncCnt and the resulting conversion factors are listed below for each stage:

Stage	EncCnt	Scaling Factor			
		Position	Velocity	Acceleration	
MTS25-Z8	34304	34304	767367.49	261.93	
MTS50-Z8	34304	34304	767367.49	261.93	
PRM1-Z8	1919.64	1919.64	42941.66	14.66	
Z8xx	34304	34304	767367.49	261.93	
Z6xx	24600	24600	550292.68	187.83	

Brushless DC Controller (TBD001, BBD10X and BBD20X) driven stages

Mathematically:

 $POS_{APT} = EncCnt \times Pos$

 $VEL_{APT} = EncCnt \times T \times 65536 \times Vel$

 $ACC_{APT} = EncCnt \times T^2 \times 65536 \times Acc$ where T = 102.4 \times 10⁻⁶

The value of EncCnt and the resulting conversion factors are listed below for each stage:

Stage	EncCnt	Scaling Factor				Scaling Factor		
		Position	Velocity	Acceleration				
DDSM100	2000	2000	13421.77	1.374				
MLS203	20000	20000	134217.73	13.744				

Stepper Motor Controller (TST001 BSC00x, BSC10x, MST601) Driven Stages

For these stepper controllers the server sends absolute micro-steps to the controllers. Depending on the stage and the stepper motor concerned there are different micro step values required to move either a linear distance in millimetres or a rotational distance in degrees.

In general for 200 full step motors (the majority of our motors) the above range of stepper controllers is designed to insert 128 micro steps for every full step of the stepper.

Thorlabs Confidential Page 15 of 234 So for a 200 full step motor the number of micro steps per full turn is defined as follows Full turn micro steps = Motor full steps per turn x Number of Micro steps per full step

For a 200 full step motor this is given by :- Full turn micro steps = $200 \times 128 = 25600$

Each stage can either be a direct drive or driven through a gear box. The table below indicates the relationship between absolute micro steps and a positional output in millimetres or degrees

This table is relevant for the range of controllers listed above. Note that micro step values are for a position is 1mm, a velocity of 1mm/sec and an acceleration of 1mm/sec/sec

Stage	Gearing	Position	Micro Step Values			
			Position(μs)	Velocity(μs/sec)	Acceleration(µs/sec²)	
DRV001	0.5mm/turn	1mm	51200	51200	51200	
DRV013	1mm/turn	1mm	25600	25600	25600	
DRV014	1mm/turn	1mm	25600	25600	25600	
DRV113	1.25mm/turn	1mm	20480	20480	20480	
DRV114	1.25mm/turn	1mm	20480	20480	20480	
FW103*	No gear	0.998deg	71	71	71	
NR360**	5.4546deg/turn	0.999deg	4693	4693	4693	

^{*}Note that there is no exact value of micro steps to get to exactly 1 degree this is because 1 turn represents 360 degrees which is 25600 micro steps. So actual resolution is 360/25600 = 0.0140625 degrees per micro step.

Stepper Motor Controller (BSC20x, MST602) Driven Stages

The BSC20x series and MST602 stepper controllers include a Trinamics encoder with a resolution of 409600 micro-steps per revolution.

This table is relevant only for the Trinamic-based range of controllers listed above. Note that micro step values are for a position is 1mm, a velocity of 1mm/sec and an acceleration of 1mm/sec/sec

Or in degrees, deg/sec or deg/sec/sec

Stage	Gearing	Position	Trinamic converted Values					
			Position(μs)	Velocity(μs/sec)	Acceleration(μs/sec ²)			
DRV001	0.5mm/turn	1mm	819200	43974656	9012			
DRV013	1mm/turn	1mm	409600	21987328	4506			
DRV014	1mm/turn	1mm	409600	21987328	4506			
DRV113	1.25mm/turn	1mm	327680	17589862	3605			
DRV114	1.25mm/turn	1mm	327680	17589862	3605			
FW103*	No gear	1.0002deg	1138	61088	13			
NR360**	5.4546deg/turn	0.99997deg	75091	4030885	826			

Thorlabs Confidential Page 16 of 234

^{**}Note that there is no exact value of micro steps to get to exactly 1 degree this is because 1 turn represents 5.4546 degrees which is 25600 micro steps. So actual resolution is 5.4546/25600 = 0.0002131 degrees

In the above table the numbers that need to be sent to the controllers are based upon the Trinamics chip set conversions. The position is just the absolute number of micro-steps as before, as compared with the BSC10X range, the only difference is the 16 times greater resolution. However for velocity and acceleration now need different conversion factors to get to correct motion profiles. For example, if a velocity of 409600 micro-steps per sec is required, then multiply by 53.68 i.e. 409600*53.68 gives 21987328 which for a 1mm lead screw would give 1mm/sec.

To accelerate at a rate of 409600 micro-steps/sec/sec (1mm/sec/sec), divide 409600 by 90.9 which gives 4506.

Thorlabs Confidential Page 17 of 234

Generic System Control Messages

Introduction

The messages described here are either system control messages, or else generic messages which apply to several or all controller types. Please see the list of controller specific commands for details on applicability to a specific controller type.

Thorlabs Confidential Page 18 of 234

MGMSG_MOD_IDENTIFY

0x0223

Function: Instruct hardware unit to identify itself (by flashing its front panel

LEDs).

Command structure (6 bytes):

0	1	2	3	4	5			
header only								
23 02 00 00 d s								

Example: Identify controller #1 (i.e. bay 0 of the TDC001 controller) by flashing

its front panel LED.

TX 23, 02, 00, 00, 21, 01

Thorlabs Confidential Page 19 of 234

Issue 9

MGMSG_MOD_SET_CHANENABLESTATE MGMSG_MOD_REQ_CHANENABLESTATE MGMSG_MOD_GET_CHANENABLESTATE 0x0210 0x0211 0x0212

Function

Sent to enable or disable the specified drive channel.

SET:

Command structure (6 bytes):

0	1	2	3	4	5		
header only							
10	02	Chan	Enable	d	S		
		Ident	State				

Channel Idents

0x01 channel 1 0x02 channel 2

Enable States

0x01 enable channel 0x02 disable channel

For single channel controllers such as the BBD10X, TDC001, the Chan Ident byte is always set to CHAN1.

Note: Although the BBD102 is in fact a 2-channel controller, 'channel' in this sense means "motor output channel within this module". Electrically, the BBD102 is a bay system, with two bays, each of them being a single channel controller, so only one channel can be addressed. There are controllers in the Thorlabs product range which indeed have multiple output channels (for example the MST601 module) for which the channel ident is used to address a particular channel.

Example: Enable the motor channel in bay 2

TX 10, 02, 01, 01, 22, 01

REQ:

Command structure (6 bytes):

0	1	2	3	4	5
		head	ler only		
11	02	Chan	0	d	S
		Ident			

As above, for single channel controllers such as the BBD10X, TDC001, the Chan Ident byte is always set to CHAN1.

Thorlabs Confidential Page 20 of 234

GET: Response structure (6 bytes):

0	1	2	3	4	5
hea	der only	,			
12	02	Chan	Enable	d	S
		Ident	State		

The meaning of the parameter bytes "Chan Ident" and "Enable State" is the same as for the SET version of the commands.

Thorlabs Confidential Page 21 of 234

MGMSG_HW_DISCONNECT

0x0002

Function: Sent by the hardware unit or host when either wants to disconnect

from the Ethernet/USB bus.

REQ:

Command structure (6 bytes):

0	1	2	3	4	5			
header only								
02 00 00 00 d s								

Example: Disconnect the BBD103 from the USB bus

TX 02, 00, 00, 00, 11, 00

MGMSG_HW_RESPONSE

0x0080

Function: Sent by the controllers to notify APT Server of some event that

requires user intervention, usually some fault or error condition that needs to be handled before normal operation can resume. The message transmits the fault code as a numerical value – see Return

Codes.

REQ:

Command structure (6 bytes):

0	1	2	3	4	5			
header only								
80	00	00	00	d	S			

Example: The BBD103 unit has encountered an over current condition

TX 80, 00, 00, 00, 01, 11

Thorlabs Confidential Page 22 of 234

MGMSG_HW_RICHRESPONSE

0x0081

Function:

Similarly to HW_RESPONSE, this message is sent by the controllers to notify APT Server of some event that requires user intervention, usually some fault or error condition that needs to be handled before normal operation can resume. However unlike HW_RESPONSE, this message also transmits a printable text string. Upon receiving the message, APT Server displays both the numerical value and the text information, which is useful in finding the cause of the problem.

REQ:

Response structure (74 bytes):

6 byte header followed by 68 byte (0x44) data packet as follows:

0	1	2	3	4	5	6	7	8	9	1	0 1	1 12	2 13	3 14	4	15
		he	ader								dat	а				
81	00	44	00	d	S	Msg	Ident	(Code			<	Note	S>	>

Msgldent	If the message is sent in response to an APT message, these	word
	bytes show the APT message number that evoked the	
	message. Most often though the message is transmitted as	
	a result of some unexpected fault condition, in which case	
	these bytes are 0x00, 0x00	
Code	This is an internal Thorlabs specific code that specifies the	word]
	condition that has caused the message (see Return Codes).	
Notes	This is a zero-terminated printable (ascii) text string that	char[64
	contains the textual information about the condition that	bytes]
	has occurred. For example: "Hardware Time Out Error".	

Thorlabs Confidential Page 23 of 234

MGMSG_HW_START_UPDATEMSGS

0x0011

Function:

Sent to start status updates from the embedded controller. Status update messages contain information about the position and status of the controller (for example limit switch status, motion indication, etc). The messages will be sent by the controller periodically until it receives a STOP STATUS UPDATE MESSAGES command. In applications where spontaneous messages (i.e. messages which are not received as a response to a specific command) must be avoided the same information can also be obtained by using the relevant GET_STATUTSUPDATES function.

Command structure (6 bytes):

0	1	2	3	4	5		
header only							
11	00	Update Rate	Unused	d	S		

The first data byte can be used to specify the update rate with which status updates are received from the controller. However, the parameter is ignored for the BBD101/102/103 controllers and the update rate is fixed at 10 regardless of the parameter sent.

REQUEST: N/A

MGMSG_HW_STOP_UPDATEMSGS

0x0012

Function:

Sent to stop status updates from the controller – usually called by a client application when it is shutting down, to instruct the controller to turn off status updates to prevent USB buffer overflows on the PC.

SET: Command structure (6 bytes):

0	1	2	3	4	5			
	header only							
12	00	00	00	d	S			

REQUEST: N/A GET: N/A

MGMSG_MOD_SET_DIGOUTPUTS MGMSG_MOD_REQ_DIGOUTPUTS MGMSG_MOD_GET_DIGOUTPUTS 0x0213 0x0214 0x0215

Function:

The CONTROL IO connector on the rear panel of the unit exposes a number of digital outputs. The number of outputs available depends on the type of unit. This message is used to configure these digital outputs.

SET:

Command structure (6 bytes):

0 1 2 3 4										
	header only									
00	05	Bit	00	d	S					

Note. On brushless DC controllers (e.g. BBD201), the digital output and trigger output use a common pin. Before calling this message to set the digital output, the trigger functionality must be disabled by calling the Set Trigger message.

The outputs are set (and returned) in the bits of the Bits parameter, input No 1 being the least significant bit and input No 4 being the most significant. The number of bits used is dependent on the number of digital outputs present on the associated hardware unit.

For example, to turn on the digital output on a BSC201 motor controller, the least significant bit of the Bits parameter should be set to 1. Similarly, to turn on all four digital outputs on a BNT001 NanoTrak unit, the bits of the Bits parameter should be set to 1111 (15), and to turn the same outputs off, the Bits should be set to 0000.

Example: Set the digital input of the BSC201 controller on:

TX 13, 02, 01, 00, 50, 01

REQ:

Command structure (6 bytes):

0	1	3	4	5

14	02	d	S							

GET:

Response structure (6 bytes):

0	1	2	3	4	5	
hea	der only					
15	02	Bit	00	d	S	

For structure see SET message above.

Thorlabs Confidential Page 31 of 234

Motor Control Messages

Introduction

The 'Motor' messages provide the functionality required for a client application to control one or more of the Thorlabs series of motor controller units. This range of motor controllers covers DC servo and stepper drivers in a variety of formats including compact Cube type controllers, benchtop units and 19" rack based modular drivers. Note for ease of description, the TSC001 T-Cube Solenoid Controller is considered here as a motor controller. The list of controllers covered by the motor messages includes:

BSC001 – 1 Channel Benchtop Stepper Driver

BSC002 – 2 Channel Benchtop Stepper Driver

BMS001 – 1 Channel Benchtop Low Power Stepper Driver

BMS002 – 2 Channel Benchtop Low Power Stepper Driver

MST601 – 2 Channel Modular Stepper Driver

MST602 – 2 Channel Modular Stepper Driver (2013 onwards)

BSC101 – 1 Channel Benchtop Stepper Driver (2006 onwards)

BSC102 – 2 Channel Benchtop Stepper Driver (2006 onwards)

BSC103 – 3 Channel Benchtop Stepper Driver (2006 onwards)

BSC201 – 1 Channel Benchtop Stepper Driver (2012 onwards)

BSC202 – 2 Channel Benchtop Stepper Driver (2012 onwards)

BSC203 – 3 Channel Benchtop Stepper Driver (2012 onwards)

BBD101 - 1 Channel Benchtop Brushless DC Motor Driver

BBD102 - 2 Channel Benchtop Brushless DC Motor Driver

BBD103 - 3 Channel Benchtop Brushless DC Motor Driver

BBD201 - 1 Channel Benchtop Brushless DC Motor Driver

BBD202 - 2 Channel Benchtop Brushless DC Motor Driver

BBD203 - 3 Channel Benchtop Brushless DC Motor Driver

OST001 – 1 Channel Cube Stepper Driver

ODC001 – 1 Channel Cube DC Servo Driver

TST001 – 1 Channel T-Cube Stepper Driver

TDC001 - 1 Channel T-Cube DC Servo Driver

TSC001 - 1 Channel T-Cube Solenoid Driver

TDIxxx – 2 Channel Brushless DC Motor Driver

The motor messages can be used to perform activities such as homing stages, absolute and relative moves, changing velocity profile settings and operation of the solenoid state (TSC001 T-Cube). With a few exceptions, these messages are generic and apply equally to both single and dual channel units.

Where applicable, the target channel is identified in the Chan Ident parameter and on single channel units, this must be set to CHAN1_ID. On dual channel units, this can be set to CHAN1_ID, CHAN2_ID or CHANBOTH_ID as required.

For details on the operation of the motor controller, and information on the principles of operation, refer to the handbook supplied with the unit.

Thorlabs Confidential Page 32 of 234

Special note regarding the TDIxxx series controllers.

Effectively the TDI Controller is a BBD202 controller with additional triggering capabilities. The commands used for the TDI Controller are identical to the BBD commands, with one additional command which relates to the triggering functionality. This message is in fact an APT wrapper for the underlying code, and as such, should be read in conjunction with the document TDI Syncronizer with Quadrature Decoder Specification.

Thorlabs Confidential Page 33 of 234

MGMSG_HW_YES_FLASH_PROGRAMMING

0x0017

Function: This message is sent by the server on start up, however, it is a

deprecated message (i.e. has no function) and can be ignored.

Command structure (6 bytes):

0	1	2	3	4	5				
header only									
16	00	d	S						

REQUEST: N/A

MGMSG_HW_NO_FLASH_PROGRAMMING

0x0018

Function: This message is sent on start up to notify the controller of the

source and destination addresses. A client application must send

this message as part of its initialization process.

SET:

Command structure (6 bytes):

Thorlabs Confidential Page 34 of 234

MGMSG_MOT_SET_POSCOUNTER MGMSG_MOT_REQ_POSCOUNTER MGMSG_MOT_GET_POSCOUNTER 0x0410 0x0411 0x0412

Function:

Used to set the 'live' position count in the controller. In general, this command is not normally used. Instead, the stage is homed immediately after power-up (at this stage the position is unknown as the stage is free to move when the power is off); and after the homing process is completed the position counter is automatically updated to show the actual position. From this point onwards the position counter always shows the actual absolute position.

SET:

Command structure (12 bytes)

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
		he	ader					Data			
10	04	06	00	d	S	Chan Ident Position					

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Position	The new value of the position counter as a 32-bit signed integer, encoded in the Intel format. The scaling between real time values and this parameter is detailed in section 7.1.	long

Example: MLS203 and BBD102: Set the position counter for channel 2 to 10.0 mm

TX 10, 04, 06, 00, A2, 01, 01, 00, 04, 0D, 03, 00

Header: 10, 04, 06, 00, A2, 01: SetPosCounter, 06 byte data packet, Channel 2.

Chan Ident: 01, 00: Channel 1 (always set to 1 for TDC001)

Position: 04, 0D, 03, 00: Set Counter to 10 mm (10 x 20,000)

REQUEST:

Command structure (6 bytes):

Data									
J	og Max	Stop I	Mode						

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Jog Mode	This 2 byte value can be 1 for continuous jogging or 2 for	word
	single step jogging. In continuous jogging mode the	
	movement continues for as long as the jogging trigger (the	
	jogging button on the GUI or an external signal) is being	
	active. In single step mode triggering jogging initiates a single	
	move whose step size is defined as the next parameter (see	
	below).	
Jog Step Size	The jog step size in encoder counts. The scaling between real	long
	time values and this parameter is detailed in section 7.1.	
Jog Min	The minimum (start) velocity in encoder counts /sec.	long
Velocity	Currently, this 4 byte value is always zero.	
Jog	The acceleration in encoder counts /sec/sec	long
Acceleration	The scaling between real time values and this parameter is	
	detailed in section 7.1.	
Jog Max	The maximum (final) velocity in encoder counts /sec. The	long
Velocity	scaling between real time values and this parameter is	
	detailed in section 7.1.	
Jog Stop	The stop mode.	word
Mode	This 16 bit word can be 1 for immediate (abrupt) stop or 2	
	for profiled stop (with controlled deceleration).	

Thorlabs Confidential Page 40 of 234

Example: MLS203 and BBD102: Set the jog parameters for channel 2 as follows:

Jog Mode: Continuous Jog Step Size:0.05 mm Jog Min Vel: Zero

Jog Accel: 10 mm/sec/sec Jog Max Vel: 99 mm/sec Jog Stop Mode: Profiled

TX 16, 04, 16, 00, A2, 01, 01, 00, 01, 00, E8, 03, 00, 00, 00, 00, 00, 00, B0,35, 00, 00, CD, CC, CC, 00, 02, 00

MGMSG_MOT_REQ_ADCINPUTS MGMSG MOT GET ADCINPUTS 0x042B 0x042C

Function:

This message reads the voltage applied to the analog input on the rear panel CONTROL IO connector, and returns a value in the ADCInput1 parameter. The returned value is in the range 0 to 32768, which corresponds to zero to 5 V.

Note. The ADCInput2 parameter is not used at this time.

In this way, a 0 to 5V signal generated by a client system could be read in by calling this method and monitored by a custom client application. When the signal reaches a specified value, the

application could instigate further actions, such as a motor move.

REQUEST:

Command structure (6 bytes):

MGMSG_MOT_SET_POWERPARAMS MGMSG MOT REQ POWERPARAMS MGMSG_MOT_GET_POWERPARAMS

0x0426 0x0427 0x0428

Note. This message is not applicable to the BSC20x and MST602 series controllers

Function:

The power needed to hold a motor in a fixed position is much smaller than that required for a move. It is good practice to decrease the power in a stationary motor in order to reduce heating, and thereby minimize thermal movements caused by expansion. This message sets a reduction factor for the rest power and the move power values as a percentage of full power. Typically, move power should be set to 100% and rest power to a value

significantly less than this.

SET:

Command structure (12 bytes)

MGMSG_MOT_MOVE_HOME MGMSG_MOT_MOVE_HOMED

0x0443 0x0444

Function: Sent to start a home move sequence on the specified motor channel

(in accordance with the home parameters above).

TX structure (6 bytes):

0	1	2	3	4	5			
header only								
43	04	Chan	0x	d	S			
		Ident						

Example: Home the motor channel in bay 2

TX 43, 04, 01, 00, 22, 01

HOMED:

Function: No response on initial message, but upon completion of home

sequence controller sends a "homing completed" message:

RX structure (6 bytes):

0	1	2	3	4	5			
header only								
44	04	Chan	0x	d	S			
		Ident						

Example: The motor channel in bay 2 has been homed

RX 44, 04, 01, 00, 01, 22

Thorlabs Confidential Page 52 of 234

MGMSG_MOT_MOVE_RELATIVE

0x0448

Function:

This command can be used to start a relative move on the specified motor channel (using the relative move distance parameter above). There are two versions of this command: a shorter (6-byte header only) version and a longer (6 byte header plus 6 data bytes) version. When the first one is used, the relative distance parameter used for the move will be the parameter sent previously by a

MGMSG_MOT_SET_MOVERELPARAMS command. If the longer version of the command is used, the relative distance is encoded in

the data packet that follows the header.

Short version:

TX structure (6 bytes):

0	1	2	3	4	5				
	header only								
48	04	Chan	0x	d	S				
		Ident							

Example: Move the motor associated with channel 2 by 10 mm. (10 mm was previously set in the MGMSG_ MOT_SET_MOVERELPARAMS method).

TX 48, 04, 01, 00, 22, 01

Long version:

The alternative way of using this command is by appending the relative move params structure (MOT_SET_MOVERELPARAMS) to this message header.

Command structure (12 bytes)

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
	header						Data				
48	04	06	00	d	S	Chan Ident Relative Distance					

Data Structure:

field	description	format
Chan Ident	The channel being addressed	Word
Relative	The distance to move. This is a 4 byte signed integer that	Long
Distance	specifies the relative distance in position encoder counts. In	
	the BBD10X series controllers the encoder resolution is	
	20,000 counts per mm, therefore to set a relative move	
	distance of 1 mm, set this parameter to 20,000 (twenty	
	thousand).	

Thorlabs Confidential Page 53 of 234 Example: Move the motor associated with chan 2 by 10 mm:

TX 48, 04, 06, 00, A2, 01, 01, 00, 40, 0D, 03, 00,

Header: 45, 04, 06, 00, A2, 01: MoveRelative, 06 byte data packet, Channel 2.

Chan Ident: 01, 00: Channel 1 (always set to 1 for TDC001)

Rel Dist: 40, 0D, 03, 00: Set absolute move distance to 10 mm (200,000 encoder counts).

Upon completion of the relative move the controller sends a Move Completed message as described following.

Thorlabs Confidential Page 54 of 234

MGMSG_MOT_MOVE_COMPLETED

0x0464

Function: No response on initial message, but upon completion of the relative

or absolute move sequence, the controller sends a "move

completed" message:

RX structure (20 bytes):

0	1	2	3	4	5			
header only								
64	04	Chan	0x	d	S			
		Ident						

Followed by a 14-byte data packet described by the same status structures (i.e. MOTSTATUS and MOTDCSTATUS) described in the STATUS UPDATES section that follows.

Thorlabs Confidential Page 55 of 234

MGMSG_MOT_MOVE_ABSOLUTE

0x0453

Function:

Used to start an absolute move on the specified motor channel (using the absolute move position parameter above). As previously described in the "MOVE RELATIVE" command, there are two versions of this command: a shorter (6-byte header only) version and a longer (6 byte header plus 6 data bytes) version. When the first one is used, the absolute move position parameter used for the move will be the parameter sent previously by a

MGMSG_MOT_SET_MOVEABSPARAMS command. If the longer version of the command is used, the absolute position is encoded in

the data packet that follows the header.

Short version:

TX structure (6 bytes):

0	1	2	3	4	5
		head	ler only		
53	04	Chan Ident	0x	d	S

Example: Move the motor associated with channel 2 to 10 mm. (10 mm was previously set in the MGMSG_ MOT_SET_MOVEABSPARAMS method).

TX 53, 04, 01, 00, 22, 01

Long version:

The alternative way of using this command by appending the absolute move params structure (MOTABSMOVEPARAMS) to this message header.

Command structure (12 bytes)

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
		hea	ıder			Data					
53	04	06	00	d	S	Chan	Ident	Absolute Distance			

Data Structure:

field	description	format
Chan Ident	The channel being addressed	Word
Absolute	The distance to move. This is a 4 byte signed integer that	Long
Distance	specifies the absolute distance in position encoder counts.	
	In the BBD10X series controllers the encoder resolution is	
	20,000 counts per mm, therefore to set an absolute move	
	distance of 100 mm, set this parameter to 2,000,000 (two	
	million).	

Thorlabs Confidential Page 56 of 234

Example: Move the motor associated with chan 2 to 10 mm:

TX 53, 04, 06, 00, A2, 01, 01, 00, 40, 0D, 03, 00,

Header: 45, 04, 06, 00, A2, 01: MoveAbsolute, 06 byte data packet, Channel 2.

Chan Ident: 01, 00: Channel 1 (always set to 1 for TDC001)

Abs Dist: 40, 0D, 03, 00: Set the absolute move distance to 10 mm (200,000 encoder counts).

Upon completion of the absolute move the controller sends a Move Completed message as previously described.

Thorlabs Confidential Page 57 of 234

MGMSG_MOT_MOVE_JOG

0x046A

Function: Sent to start a jog move on the specified motor channel.

TX structure (6 bytes):

0	1	2	3	4	5				
	header only								
6A	04	Chan	Direction	d	S				
		Ident							

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Direction	The direction to Jog. Set this byte to 0x01 to jog forward, or to 0x02 to jog in the reverse direction.	word

Upon completion of the jog move the controller sends a Move Completed message as previously described.

Note. The direction of the jog move is device dependent, i.e. on some devices jog forward may be towards the home position while on other devices it could be the opposite.

Thorlabs Confidential Page 58 of 234

MGMSG_MOT_MOVE_VELOCITY

0x0457

Function: This command can be used to start a move on the specified motor

channel.

When this method is called, the motor will move continuously in the

specified direction, using the velocity parameters set in the

MGMSG_MOT_SET_MOVEVELPARAMS command until either a stop command (either StopImmediate or StopProfiled) is called, or a limit

switch is reached.

TX structure (6 bytes):

0	1	2	3	4	5				
	header only								
57	04	Chan	Direction	d	S				
		Ident							

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Direction	The direction to Jog. Set this byte to 0x01 to move forward, or to 0x02 to move in the reverse direction.	word

Upon completion of the move the controller sends a Move Completed message as previously described.

Example: Move the motor associated with channel 2 forwards.

TX 57, 04, 01, 01, 22, 01

Thorlabs Confidential Page 59 of 234

MGMSG_MOT_MOVE_STOP

0x0465

Function: Sent to stop any type of motor move (relative, absolute, homing or

move at velocity) on the specified motor channel.

TX structure (6 bytes):

0	1	2	3	4	5				
	header only								
65	04	Chan	Stop	d	S				
		Ident	Mode						

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Stop Mode	The stop mode defines either an immediate (abrupt) or profiles tops. Set this byte to 0x01 to stop immediately, or to	word
	0x02 to stop in a controller (profiled) manner.	

Upon completion of the stop move the controller sends a Move Stopped message as described following

Thorlabs Confidential Page 60 of 234

MGMSG_MOT_MOVE_STOPPED

0x0466

Function: No response on initial message, but upon completion of the stop

move, the controller sends a "move stopped" message:

RX structure (20 bytes):

0	1	2	3	4	5					
	header only									
66 04 0E 0x d s										

Followed by a 14-byte data packet described by the same status structures (i.e. MOTSTATUS and MOTDCSTATUS) described in the STATUS UPDATES section that follows.

Thorlabs Confidential Page 61 of 234 MGMSG_MOT_SET_DCPIDPARAMS MGMSG_MOT_REQ_DCPIDPARAMS MGMSG_MOT_GET_DCPIDPARAMS 0x04A0 0x04A1 0x04A2

Function:

Used to set the position control loop parameters for the specified motor channel.

The motion processor within the controller uses a position control loop to determine the motor command output. The purpose of the position loop is to match the actual motor position and the

demanded position. This is achieved by comparing the demanded position with the actual position to create a position error, which is then passed through a digital PID-type filter. The filtered value is the motor command output.

NOTE. These settings apply to LM628/629 based servo controllers (only TDC001 at this time). Refer to data sheet for National Semiconductor LM628/LM629 for further details on setting these PID related parameters.

SET:Command structure (26 bytes)
6 byte header followed by 20 byte data packet as follows:

Issue 9

MGMSG_MOT_SET_AVMODES MGMSG_MOT_REQ_AVMODES MGMSG_MOT_GET_AVMODES 0x04B3 0x04B4 0x04B5

Function:

The LED on the control keypad can be configured to indicate certain

driver states.

All modes are enabled by default. However, it is recognised that in a

light sensitive environment, stray light from the LED could be undesirable. Therefore it is possible to enable selectively, one or all

of the LED indicator modes described below by setting the

appropriate value in the Mode Bits parameter.

SET:

Command structure (10 bytes)

6 byte header followed by 4 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9
	header						D	ata	
В3	04	04	00	d	S	Chan	Ident	Mode	Bits

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
ModeBits	The mode of operation for the LED is set according to the hex value entered in the mode bits. 1 LEDMODE_IDENT: The LED will flash when the 'Ident' message is sent. 2 LEDMODE_LIMITSWITCH: The LED will flash when the motor reaches a forward or reverse limit switch. 8 LEDMODE_MOVING: The LED is lit when the motor is moving.	word

Example: Set the LED to flash when the IDENT message is sent, and also when the motor is moving.

TX B3, 04, 04, 00, D0, 01, 01, 00, 09, 00,

Header: B3, 04, 04, 00, D0, 01: SetAVModes, 04 byte data packet, Generic USB Device.

Chan Ident: 01, 00: Channel 1 (always set to 1 for TDC001)

ModeBits: 09, 00 (i.e. 1 + 8)

Similarly, if the ModeBits parameter is set to '11' (1 + 2 + 8) all modes will be enabled.

MGMSG_MOT_SET_POTPARAMS MGMSG_MOT_REQ_POTPARAMS MGMSG_MOT_GET_POTPARAMS 0x04B0 0x04B1 0x04B2

Function:

The potentiometer slider on the control panel is sprung, such that when released it returns to it's central position. In this central position the motor is stationary. As the slider is moved away from the center, the motor begins to move; the speed of this movement increases as the slider deflection is increased. Bidirectional control of motor moves is possible by moving the slider in both directions. The speed of the motor increases by discrete amounts rather than continuously, as a function of slider deflection. These speed settings are defined by 4 pairs of parameters. Each pair specifies a pot deflection value (in the range 0 to 127) together with an associated velocity (set in encoder counts/sec) to be applied at or beyond that deflection. As each successive deflection is reached by moving the pot slider, the next velocity value is applied. These settings are applicable in either direction of pot deflection, i.e. 4 possible velocity settings in the forward or reverse motion directions. **Note**. The scaling factor between encoder counts and mm/sec depends on the specific stage/actuator being driven.

SET:Command structure (32 bytes)
6 byte header followed by 26 byte data packet as follows:

	_	2	3	4	5	6	7	8	9	10	11
	header					Data

	L										

24	25	26	27	28	29	30	31
Data							
Vel3 Wnd3 Vel4							

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
ZeroWnd	The deflection from the mid position (in ADC counts 0 to 127) before motion can start	word
Vel1	The velocity (in encoder counts /sec) to move when between Wnd0 and PotDef1	long
Wnd1	The deflection from the mid position (in ADC counts, Wnd0 to 127) to apply Vel1	word
Vel2	The velocity (in encoder counts /sec) to move when between PotDef1 and PotDef2	long
Wnd2	The deflection from the mid position (in ADC counts, PotDef1 to 127) to apply Vel2	word

Thorlabs Confidential Page 66 of 234

Vel3	The velocity (in encoder counts/sec) to move when between	long
	PotDef2 and PotDef3	
Wnd3	The deflection from the mid position (in ADC counts PotDef2	word
	to 127) to apply Vel3	
Vel4	The velocity (in encoder counts /sec) to move when beyond	long
	PotDef3	

Example: For the Z8 series motors, there are 512 encoder counts per revolution of the motor. The output shaft of the motor goes into a 67:1 planetary gear head. This requires the motor to rotate 67 times to rotate the 1.0 mm pitch lead screw one revolution. The end result is the lead screw advances by 1.0 mm.

Therefore, a 1 mm linear displacement of the actuator is given by

512 x 67 = 34,304 encoder counts

whereas the linear displacement of the lead screw per encoder count is given by

1.0 mm / 34,304 counts = 2.9 x 10-5 mm (29 nm).

Typical parameters settings Hex (decimal)

ZeroWnd - 14 (20)

Vel1 - 66, 0D,00,00 (3430)

Wnd1 - 32 (50)

Vel2 - CC, 1A, 00, 00 (6860)

Wnd2 - 50 (80)

Vel3 – 32, 28, 00, 00 (10290)

Wnd3 - 64 (100)

Vel4 – 00, 43, 00, 00 (17152)

Using the parameters above, no motion will start until the pot has been deflected to 20 (approx 1/6 full scale deflection), when the motor will start to move at 0.1mm/sec. At a deflection of 50 (approx 2/5 full scale deflection) the motor velocity will increase to 0.2mm/sec, and at 80, velocity will increase to 0.3 mm/sec. When the pot is deflected to 100 and beyond, the velocity will be 0.5 mm/sec.

Note. It is acceptable to set velocities equal to each other to reduce the number of speeds, however this is not allowed for the deflection settings, whereby the Wnd3 Pot Deflection value must be greater than Wnd2 Pot Deflection value.

TX B0, 04, 1A, 00, D0, 01, 01, 00, 01, 00, E8, 03, 00, 00, 00, 00, 00, 00, B0,35, 00, 00, CD, CC, CC, 00, 02, 00

Integral	The integral gain. Together with the Proportional and	word
	Differential, these terms determine the system response	
	characteristics and accept values in the range 0 to 32767.	
ILimPos	The Integral Limit parameter is used to cap the value of the	dword
	Integrator to prevent runaway of the integral sum at the	
	output. It accepts values in the range 0 to 7FFFFFFF. If set to	
	0 then the integration term in the PID loop is ignored.	
Differential	The differential gain. Together with the Proportional and	word
	Integral, these terms determine the system response	
	characteristics and accept values in the range 0 to 32767.	
KdTimePos	Under normal circumstances, the derivative term of the PID	word
	loop is recalculated at every servo cycle. However, it may be	
	desirable to reduce the sampling rate to a lower value, in	
	order to increase stability or simplify tuning. The KdTimePos	
	parameter is used to set the sampling rate. For example, if	

Thorlabs Confidential Page 72 of 234

	set to 10, the derivative term is calculated every 10 servo	
	cycles. The value is set in cycles, in the range 1 to 32767.	
KoutPos	The KoutPos parameter is a scaling factor applied to the	word
	output of the PID loop. It accepts values in the range 0 to	
	65535, where 0 is 0% and 65535 is 100%.	
KvffPos	The KvffPos and KaffPos parameters are velocity and	word
KaffPos	acceleration feed-forward terms that are added to the	word
	output of the PID filter to assist in tuning the motor drive	
	signal. They accept values in the range 0 to 32767.	
PosErrLim	Under certain circumstances, the actual encoder position	dword
	may differ from the demanded position by an excessive	
	amount. Such a large position error is often indicative of a	
	potentially dangerous condition such as motor failure,	
	encoder failure or excessive mechanical friction. To warn of,	
	and guard against this condition, a maximum position error	
	can be set in the PosErrLim parameter, in the range 0 to	
	7FFFFFF. The actual position error is continuously	
	compared against the limit entered, and if exceeded, the	
	Motion Error bit (bit 15) of the Status Register is set and the	
	associated axis is stopped.

MGMSG_MOT_SET_PMDMOTOROUTPUTPARAMS MGMSG_MOT_REQ_PMDMOTOROUTPUTPARAMS MGMSG_MOT_GET_PMDMOTOROUTPUTPARAMS 0x04DA 0x04DB 0x04DC

Function: Used to set certain limits that can be applied to the motor drive

signal. The individual limits are described below.

SET:

Command structure (20 bytes)

6 byte header followed by 14 byte data packet as follows:

header	Data
DA 04 0E 00 d s	Chan Ident Cont Current Lim Energy Lim

12	13	14	15	16	17	18	19			
	Data									
Moto	or Limit	Moto	r Bias	Not	Used	Not	Used			

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
ContCurrentLim	The system incorporates a current 'foldback' facility,	word
	whereby the continuous current level can be capped. The	
	continuous current limit is set in the ContCurrentLim	
	parameter, which accepts values as a percentage of	
	maximum peak current, in the range 0 to 32767 (0 to	
	100%), which is the default maximum level set at the	
	factory (this maximum value cannot be altered).	
EnergyLim	When the current output of the drive exceeds the limit set	word
	in the ContCurrentLim parameter, accumulation of the	
	excess current energy begins. The EnergyLim parameter	
	specifies a limit for this accumulated energy, as a	
	percentage of the factory set default maximum, in the	
	range 0 to 32767 (0 to 100%). When the accumulated	
	energy exceeds the value specified in the EnergyLim	
	parameter, a 'current foldback' condition is said to exist,	
	and the commanded current is limited to the value	
	specified in the ContCurrentLim parameter. When this	
	occurs, the Current Foldback status bit (bit 25) is set in the	
	Status Register. When the accumulated energy above the	
	ContCurrentLim value falls to 0, the limit is removed and	
	the status bit is cleared.	
MotorLim	The MotorLim parameter sets a limit for the motor drive	word
	signal and accepts values in the range 0 to 32767 (100%). If	
	the system produces a value greater than the limit set, the	
	motor command takes the limiting value. For example, if	
	MotorLim is set to 30000 (91.6%), then signals greater	
	than 30000 will be output as 30000 and values less than	
	-30000 will be output as -30000.	
MotorBias	When an axis is subject to a constant external force in one	word

Thorlabs Confidential Page 75 of 234

	direction (such as a vertical axis pulled downwards by gravity) the servo filter can compensate by adding a constant DC bias to the output. This bias is set in the MotorBias parameter, which accepts values in the range -32767 to 32768. The default value is 0. Once set, the motor bias is applied while the position loop is enabled.

MGMSG_MOT_SET_PMDTRACKSETTLEPARAMS 0x04E0
MGMSG_MOT_REQ_PMDTRACKSETTLEPARAMS 0x04E1
MGMSG_MOT_GET_PMDTRACKSETTLEPARAMS 0x04E2

Function:

Moves are generated by an internal profile generator, and are based on either a trapezoidal or S-curve trajectory. A move is considered complete when the profile generator has completed the calculated move and the axis has 'settled' at the demanded position. This command contains parameters which specify when the system is settled.

Further Information

The system incorporates a monitoring function, which continuously indicates whether or not the axis has 'settled'. The 'Settled' indicator is bit 14 in the Status Register and is set when the associated axis is settled. Note that the status bit is controlled by the processor, and cannot be set or cleared manually.

The axis is considered to be 'settled' when the following conditions are met:

- * the axis is at rest (i.e. not performing a move),
- * the error between the demanded position and the actual motor position is less than or equal to a specified number of encoder counts (0 to 65535) set in the *SettleWnd* parameter (Settle Window),
- * the above two conditions have been met for a specified number of cycles (settle time, 1 cycle = $102.4 \mu s$), set in the *SettleTime* parameter (range 0 to 32767).

The above settings are particularly important when performing a sequence of moves. If the PID parameters are set such that the settle window cannot be reached, the first move in the sequence will never complete, and the sequence will stall. The settle window and settle time values should be specified carefully, based on the required positional accuracy of the application. If positional accuracy is not a major concern, the settle time should be set to '0'. In this case, a move will complete when the motion calculated by the profile generator is completed, irrespective of the actual position attained, and the settle parameters described above will be ignored.

The processor also provides a 'tracking window', which is used to monitor servo performance outside the context of motion error. The tracking window is a programmable position error limit within which the axis must remain, but unlike the position error limit set in the SetDCPositionLoopParams method, the axis is not stopped if it moves outside the specified tracking window. This function is useful for processes that rely on the motor's correct tracking of a set trajectory within a specific range. The tracking window may also be used as an early warning for performance problems that do not yet qualify as motion error.

The size of the tracking window (i.e. the maximum allowable position error while remaining within the tracking window) is specified in the *TrackWnd* parameter, in the range 0 to 65535. If the position error of the axis exceeds this value, the Tracking Indicator status bit (bit 13) is

Thorlabs Confidential Page 77 of 234

set to 0 in the Status Register. When the position error returns to within the window boundary, the status bit is set to 1.

MGMSG_MOT_SET_PMDPROFILEMODEPARAMS 0x04E3
MGMSG_MOT_REQ_PMDPROFILEMODEPARAMS 0x04E4
MGMSG_MOT_GET_PMDPROFILEMODEPARAMS 0x04E5

Function:

The system incorporates a trajectory generator, which performs calculations to determine the instantaneous position, velocity and acceleration of each axis at any given moment. During a motion profile, these values will change continuously. Once the move is complete, these parameters will then remain unchanged until the next move begins.

The specific move profile created by the system depends on several factors, such as the profile mode and profile parameters presently selected, and other conditions such as whether a motion stop has been requested. This method is used to set the profile mode to either 'Trapezoidal' or 'S-curve'.

SET:Command structure (18 bytes)
6 byte header followed by 12 byte data packet as follows:

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Mode	The move profile to be used:	word
	Trapezoidal: 0	
	S-Curve: 2	
	The Trapezoidal profile is a standard, symmetrical	
	acceleration/deceleration motion curve, in which the start	
	velocity is always zero.	
	The S-curve profile is a trapezoidal curve with an additional	
	'Jerk' parameter, which limits the rate of change of	
	acceleration and smooths out the contours of the motion	
	profile. In this profile mode, the acceleration increases	
	gradually from 0 to the specified acceleration value, then	
	decreases at the same rate until it reaches 0 again at the	
	specified velocity. The same sequence in reverse brings the	
	axis to a stop at the programmed destination position.	
Jerk	The Jerk value is specified in mm/s ³ in the Jerk parameter,	dword
	and accepts values in the range 0 to 4294967295. It is used	
	to specify the maximum rate of change in acceleration in a	
	single cycle of the basic trapezoidal curve. 1.0 mm/s ³ is	
	equal to 92.2337 jerk units.

MGMSG_MOT_SET_PMDCURRENTLOOPPARAMS 0x04D4
MGMSG_MOT_REQ_PMDCURRENTLOOPPARAMS 0x04D5
MGMSG_MOT_GET_PMDCURRENTLOOPPARAMS 0x04D6

Function: Used to set the current control loop parameters for the specified

motor channel.

The motion processors within the BBD series controllers use digital current control as a technique to control the current through each phase winding of the motors. In this way, response times are improved and motor efficiency is increased. This is achieved by comparing the required (demanded) current with the actual current to create a current error, which is then passed through a digital PI-type filter. The filtered current value is used to develop an output voltage for each motor coil.

This method sets various constants and limits for the current

feedback loop.

MGMSG_MOT_SET_PMDSETTLEDCURRENTLOOPPARAMS 0x04E9
MGMSG_MOT_REQ_PMDSETTLEDCURRENTLOOPPARAMS 0x04EA
MGMSG_MOT_GET_PMDSETTLEDCURRENTLOOPPARAMS 0x04EB

Function: These commands assist in maintaining stable operation and

reducing noise at the demanded position. They allow the system to be tuned such that errors caused by external vibration and manual handling (e.g. loading of samples) are minimized, and are applicable only when the stage is settled, i.e. the Axis Settled status bit (bit 14)

is set.

SET:

Command structure (24 bytes)

6 byte header followed by 18 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11

MGMSG_MOT_GET_STATUSUPDATE

0x0481

Function: This message is returned when a status update is requested for the

specified motor channel. This request can be used instead of

enabling regular updates as described above.

GET:

Status update messages are received with the following format:-

Response structure (20 bytes)

6 byte header followed by 14 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
header					Data						
81	04	0E	00	d	S	Chan	Chan Ident Position				
12	13	14	15	16	17	18	19				
	Data										
EncCount Status					s Bits						

Data Structure:

field	description	format
Chan Ident	The channel being addressed is always P_MOD_CHAN1	word
	(0x01) encoded as a 16-bit word (0x01 0x00)	
Position	The position encoder count. In the APT Stepper Motor	long
	controllers the encoder resolution is 25,600 counts per mm,	
	therefore a position change of 1 mm would be seen as this	
	parameter changing by 25,600. The LONG variable is a 32 bit	
	value, encoded in the data stream in the Intel format.	
EncCount	For use with encoded stages only.	long
Status Bits	The meaning of individual bits in this 32-bit variable is	dword
	described in the bit mask table below (1 = active, 0 =	
	inactive).	

bit mask	meaning
0x0000001	forward (CW) hardware limit switch is active
0x00000002	reverse (CCW) hardware limit switch is active
0x00000004	forward (CW) software limit switch is active
0x00000008	reverse (CCW) software limit switch is active
0x00000010	in motion, moving forward (CW)
0x00000020	in motion, moving reverse (CCW)
0x00000040	in motion, jogging forward (CW)
0x00000080	in motion, jogging reverse (CCW)
0x00000100	motor connected
0x00000200	in motion, homing
0x00000400	homed (homing has been completed)
0x00001000	interlock state (1 = enabled)

Thorlabs Confidential Page 90 of 234

This is not full list of all the bits but the remaining bits reflect information about the state of the hardware that in most cases does not affect motion.

MGMSG_MOT_REQ_STATUSUPDATE

0x0480

Function: Used to request a status update for the specified motor channel.

This request can be used instead of enabling regular updates as

described above.

REQUEST:

Command structure (6 bytes):

0	1	2	3	4	5			
	header only							
80	04	Chan	00	d	S			
		Ident						

GET:

See previous details on MGMSG MOT GET STATUSUPDATE 0x0481.

Thorlabs Confidential Page 91 of 234

MGMSG_MOT_GET_DCSTATUSUPDATE

0x0491

Function: This message is returned when a status update is requested for the

specified motor channel. This request can be used instead of

enabling regular updates as described above.

GET:

Status update messages are received with the following format:-

Response structure (20 bytes)

6 byte header followed by 14 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
		hea	ıder			Data					
91	04	0E	00	d	S	Chan Ident Position					
12	13	14	15	16	17	18	19				
	Data										
Velo	ocity	Rese	rved		Statu	s Bits					

Data Structure:

field	description	format
Chan Ident	The channel being addressed is always P_MOD_CHAN1	word
	(0x01) encoded as a 16-bit word (0x01 0x00)	
Position	The position encoder count. In the BBD10X series	long
	controllers the encoder resolution is 20,000 counts per mm,	
	therefore a position change of 1 mm would be seen as this	
	parameter changing by 20,000 (twenty thousand). The	
	LONG variable is a 32 bit value, encoded in the data stream	
	in the Intel format, so for example a position of 1 million	
	encoder counts (equivalent to 50 mm) would be sent as	
	byte stream 0x40, 0x42, 0x0F, 0x00 since 1 million is	
	hexadecimal 0xF4240.	
Velocity	The actual velocity. Scaling is 204.8 per mm/sec, so a real-	word
	life measured speed of 100 mm/sec is read as 205. Again,	
	the two-byte data stream will be encoded in the Intel	
	format.	
Reserved	Currently Not Used	Word
Status Bits	The meaning of individual bits in this 32-bit variable is	dword
	described in the bit mask table below	

bit mask meaning 0x00000001 forward hardware limit switch is active 0x00000002 reverse hardware limit switch is active 0x00000010 in motion, moving forward 0x00000020 in motion, moving reverse 0x00000040 in motion, jogging forward 0x00000080 in motion, jogging reverse 0x00000200 in motion, homing

Thorlabs Confidential Page 92 of 234

0x00000400 homed (homing has been completed)

0x00001000 tracking 0x00002000 settled

0x00004000 motion error (excessive position error)

0x01000000 motor current limit reached

0x80000000 channel is enabled

This is not full list of all the bits but the remaining bits reflect information about the state of the hardware that in most cases does not affect motion.

MGMSG MOT REQ DCSTATUSUPDATE

0x0490

Function: Used to request a status update for the specified motor channel.

This request can be used instead of enabling regular updates as

described above.

REQUEST:

Command structure (6 bytes):

0	1	2	3	4	5			
	header only							
90	04	Chan	00	d	S			
		Ident						

GET:

See previous details on MGMSG MOT GET DCSTATUSUPDATE 0x0491.

MGMSG_MOT_ACK_DCSTATUSUPDATE

0x0492

Only Applicable If Using USB COMMS. Does not apply to RS-232 COMMS

Function: If using the USB port, this message called "server alive" must be sent

by the server to the controller at least once a second or the

controller will stop responding after ~50 commands.

The controller keeps track of the number of "status update" type of messages (e.g.move complete message) and it if has sent 50 of these without the server sending a "server alive" message, it will

stop sending any more "status update" messages.

This function is used by the controller to check that the PC/Server

has not crashed or switched off. There is no response.

Structure (6 bytes):

0	1	2	3	4	5					
	header only									
92	04	00	00	d	S					

TX 92, 04, 00, 00, 21, 01

MGMSG_MOT_SUSPEND_ENDOFMOVEMSGS

0x046B

Function: Sent to disable all unsolicited end of move messages and error

messages returned by the controller, i.e.

MGMSG_MOT_MOVE_STOPPED MGMSG_MOT_MOVE_COMPLETED MGMSG_MOT_MOVE_HOMED

Command structure (6 bytes):

0	1	2	3	4	5		
header only							
6B 04 00 00 d							

Thorlabs Confidential Page 95 of 234

MGMSG_MOT_RESUME_ENDOFMOVEMSGS

0x046C

Function: Sent to resume all unsolicited end of move messages and error

messages returned by the controller, i.e.

MGMSG_MOT_MOVE_STOPPED MGMSG_MOT_MOVE_COMPLETED MGMSG_MOT_MOVE_HOMED

The command also disables the error messages that the controller

sends when an error conditions is detected:

MGMSG_HW_RESPONSE MGMSG_HW_RICHRESPONSE

This is the default state when the controller is powered up.

Command structure (6 bytes):

0	1	2	3	4	5		
header only							
6C	04	00	00	d	S		

Thorlabs Confidential Page 96 of 234

MGMSG_MOT_SET_TRIGGER0x0500MGMSG_MOT_REQ_TRIGGER0x0501MGMSG_MOT_GET_TRIGGER0x0502

Function:

This message is used to configure the Motor controller for triggered move operation. It is possible to configure a particular controller to respond to trigger inputs, generate trigger outputs or both respond to and generate a trigger output. When a trigger input is received, the unit can be set to initiate a move (relative, absolute or home). Similarly the unit can be set to generate a trigger output signal when a specified event (e.g move initiated) occurs. For those units configured for both input and output triggering, a move can be initiated via a trigger input while at the same time, a trigger output can be generated to initiate a move on another unit.

The trigger settings can be used to configure multiple units in a master – slave set up, thereby allowing multiple channels of motion to be synchronized. Multiple moves can then be initiated via a single

software or hardware trigger command.

SET: Command structure (6 bytes):

0	1	2	3	4	5			
header only								
00	05		Mode	d	S			
		Ident						

Note. This message operates differently when used with brushless DC controllers (e.g. BBD20x and TBD001) as opposed to other motor controllers as described in the following paragraphs.

All stepper and brushed DC controllers (BSC20x, TST001, TDC001)

field	description	format
Chan Ident	The channel being addressed	char
Mode	This parameter sets the trigger mode and move type to be	char
	initiated according to the numerical value entered in bits 0 to	
	7 as follows	
	Bit 0 (0x01): TRIGIN_ENABLE set to enable physical trigger	
	input	
	Bit 1 (0x02): TRIGOUT_ENABLE set to enable trigger output	
	function (mode set by BIT2 or BIT3 below)	
	Bit 2 (0x04): TRIGOUT_MODEFOLLOW set to enable physical	
	trigger output to mirror trig in	
	Bit 3 (0x08): TRIGOUT_MODEMOVEEND set to enable	
	physical trigger output, remains active (high) until move end	
	Bit 4 (0x10): TRIG_RELMOVE set for relative move on trigger	
	Bit 5 (0x20): TRIG_ABSMOVE set for absolute move on	
	trigger	
	Bit 6 (0x40): TRIG_HOMEMOVE set for home sequence on	

Thorlabs Confidential Page 97 of 234

trigger Bit 7 (0x80): TRIGOUT NOTRIGIN set to enable physical	
trigger output with no physical trigger in (i.e. sw initiated	
trigger)	

Brushless DC controllers only (BBD20x and TBD001)

field	description	format
Chan Ident	The channel being addressed	char
Chan Ident Mode	The channel being addressed This parameter sets the trigger mode and move type according to the numerical value entered in bits 0 to 7 as follows Bit 0 (0x01): TRIGIN_HIGH The Trigger input can be configured to initiate a relative, absolute or homing home, either on the rising or falling edge of the signal driving it. As the trigger input is edge sensitive, it needs to see a logic LOW to HIGH transition ("rising edge") or a logic HIGH to LOW transition ("falling edge") for the move to be started. Additionally, the move parameters must be downloaded to the unit prior to the move using the relevant relative move or absolute move methods as described below. A move already in progress will not be interrupted; therefore external triggering will not work until the previous move has been completed. If this bit is set, the logic state is set HIGH. Bit 1 (0x02): TRIGIN_RELMOVE set to enable trigger in and initiate a relative move (specified using the latest MoveRelative or MoveRelativeEx settings) when a trigger input signal is received. Bit 2 (0x04): TRIGIN_ABSMOVE set to enable trigger in and initiate an absolute move (specified using the latest MoveAbsolute or MoveAbsoluteEx settings) when a trigger input signal is received. Bit 3 (0x08): TRIGIN_HOMEMOVE set to enable trigger in and initiate a home move (specified using the latest MoveHome settings) whan atrigger input signal is received. Bit 4 (0x10): TRIGOUT_HIGH The Trigger output can be configured to be asserted to either logic HIGH or LOW as a function of certain motion-related conditions, such as when a move is in progress (In Motion), complete (Move Complete) or reaches the constant velocity phase on its trajectory (Max Vel). The logic state of the output will remain the same for as long as the chosen condition is true. If this bit is set, the logic state is set HIGH when the following conditions are true. Bit 5 (0x20): TRIGOUT_INMOTION set to enable trigger out (triggered when in motion) Bit 6 (0x40): TRIGOUT_MOTIONCOMPLETE set to enable trigger out (t	char

Thorlabs Confidential Page 98 of 234 **Example:** Set the trigger mode for channel 1 of the BBD201 controller as

follows:

Trigger Input Rising Edge (High)

Enable trigger input and initiate a Relative Move

Trigger Output Rising Edge (High)

Enable trigger output when move complete.

MGMSG_MOT_SET_TDIPARAMS MGMSG_MOT_REQ_TDIPARAMS MGMSG_MOT_GET_TDIPARAMS 0x04FB 0x04FC 0x04FD

This message is applicable only to the TDI series controllers.

Function:

This low level command is used to communicate with the FPGA on the TDI trigger board and acts as an APT wrapper to the messages that are used to control the FPGA. As a result, these commands must be used in conjunction with the document "TDI Synchronizer with Quadrature Decoder Specification".

The triggering functions of the TDI controller are implemented on an FPGA. The various triggering parameters are mapped into FPGA register locations. All registers are accessed as 16-bit values, with the address and data combined into a 16-bit word.

The SET messages correspond to writing to FPGA register locations. In the 16-bit TDI data word used for communicating with the FPGA bit 15 indicates whether the register is read or written; for write operations bit 15 must be '0'. Therefore all SET messages carry a TDI data word whose most significant bit is '0'.

Likewise, all REQ messages carry a TDI data word whose most

significant bit is '1'.

SET:

Command structure (10 bytes)

6 byte header followed by 4 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9
	header						Do	ata	
FB	04	04	00	91	01	Chan	Ident	TDI Data	

Data Structure:

field	Description	format
Chan Ident	The channel being addressed	word
TDI Data	The 16-bit TDI data, as shown in the FPGA register table	word

Example: Set the GPO1 register to 0x08. The FPGA register table shows that the 16-bit

register value for setting GPO1 to 0x08 is 0x4008. This value must be

transmitted to the FPGA. The corresponding APT command is:

Tx: FB, 04, 04, 00, 91, 01, 01, 00, 08, 40

Header: FB, O4, O4, O0, 91, O1: SetTDIParams, O4 byte data packet, destination =

motherboard in a card slot system (0x11) OR'ed with 0x80. *Chan Ident: 01, 00*: Channel 1 (always set to 1 for TDI001)

TDI Data: 0x4008 (byte swap due to Intel format)

Thorlabs Confidential Page 100 of 234

Solenoid Control Messages

Introduction

The APT Solenoid drive uses the Motor server control instance control its functionality. The messages listed here provide the extra functionality required for a client application to control one or more of the Thorlabs series of TSC001 T-Cube solenoid driver units.

Thorlabs Confidential Page 103 of 234

MGMSG_MOT_SET_SOL_OPERATINGMODE MGMSG_MOT_REQ_SOL_OPERATINGMODE MGMSG_MOT_GET_SOL_OPERATINGMODE

0x04C0 0x04C1 0x04C2

Function: This message sets the operating mode of the solenoid driver.

SET:

Command structure (6 bytes):

0	1	2	3	4	5						
	header only										
CO	04	Chan Ident	Mode	d	S						

Data Structure:

field	description	format
Chan Ident	The channel being addressed	char
Operating	The operating mode of the unit as a 4 bit integer:	char
Mode	0x01 SOLENOID_MANUAL - In this mode, operation of the	
	solenoid is via the front panel 'Enable' button, or by the	
	'Output' buttons on the GUI panel.	
	0x02 SOLENOID_SINGLE - In this mode, the solenoid will	
	open and close each time the front panel 'Enable' button is	
	pressed, or the 'Output ON' button on the GUI panel is	
	clicked. The ON and OFF times are specified by calling the	
	MGMSG_MOT_SET_SOL_CYCLEPARAMS message.	
	0x03 SOLENOID_AUTO - In this mode, the solenoid will open	
	and close continuously after the front panel 'Enable' button	
	is pressed, or the 'Output ON' button on the GUI panel is	
	clicked. The ON and OFF times, and the number of cycles	
	performed, are specified by calling the	
	MGMSG_MOT_SET_SOL_CYCLEPARAMS message.	
	0x04 SOLENOID_TRIGGER - In Triggered mode, a rising edge	
	on rear panel TRIG IN BNC input will start execution of the	
	parameters programmed on the unit (On Time, Off Time,	
	Num Cycles - see MGMSG MOT SET SOL CYCLEPARAMS	
	message.). The unit must be primed (i.e. the ENABLE button	
	pressed and the ENABLED LED lit) before the unit can	
	respond to the external trigger.	

Example: Set the control mode to 'Single'.

TX C0, 04, 01, 02, 50, 01

C0,04 SET_SOL_OPERATINGMODE

01, Channel 1

02, Set mode to 'Single'

	Data										

NumCycles

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
OnTime	The time which the solenoid is activated	long
	(100ms to 10,000s in 250 μs steps)	
OffTime	The time which the solenoid is a de-activated	long
	(100ms to 10,000s in 250 μs steps)	
NumCycles	If the unit is operating in 'Auto' mode, the number of	long
	Open/Close cycles to perform. (0 to 1,000,000) is specified	
	in the NumCycles parameter. If set to '0' the unit cycles	
	indefinitely. If the unit is not operating in 'Auto' mode, the	
	NumCycles parameter is ignored.	

Example: Set the cycle parameters parameters for chan 1 as follows:

OnTime: 1000ms OffTime: 1000ms NumCycles: 20

TX C3, O4, OE, O0, D0, O1, O1, O0, A0, OF, O0, O0, A0, OF, O0, O0, 14, O0, O0, O0

Header: C3, O4, OE, O0, D0, O1: Set Cycle Params, D0H (14) byte data packet, Generic USB

Device.

Chan Ident: 01, 00: Channel 1 (always set to 1 for TSC001)

OnTime: A0, OF, 00, 00: Set on time to 1000 ms (i.e. $4000 \times 250 \mu s$) OffTime: A0, OF, 00, 00: Set off time to 1000 ms (i.e. $4000 \times 250 \mu s$)

NumCycles: 14, 00, 00, 00: Set number of cycles to 20

Piezo Control Messages

Introduction

The 'Piezo' control messages provide the functionality required for a client application to control one or more of the Thorlabs series of piezo controller units. This range of controllers covers both open and closed loop piezo control in a variety of formats including compact Cube type controllers, benchtop units and 19" rack based modular drivers. **Note.** For ease of description, the TSG001 T-Cube Strain Gauge reader is considered here as a piezo controller. The list of controllers covered by the piezo messages includes:-

BPC001 – 1 Channel Benchtop Piezo Driver
BPC002 – 2 Channel Benchtop Piezo Driver
MPZ601 – 2 Channel Modular Piezo Driver
BPC101 – 1 Channel Benchtop Piezo Driver (2006 onwards)
BPC102 – 2 Channel Benchtop Piezo Driver (2006 onwards)
BPC103 – 3 Channel Benchtop Piezo Driver (2006 onwards)
BPC201 – 1 Channel Benchtop Piezo Driver (2007 onwards)
BPC202 – 2 Channel Benchtop Piezo Driver (2007 onwards)
BPC203 – 3 Channel Benchtop Piezo Driver (2007 onwards)
BPC301 – 1 Channel Benchtop Piezo Driver (2011 onwards)
BPC303 – 3 Channel Benchtop Piezo Driver (2012 onwards)
TPZ001 – 1 Channel T-Cube Piezo Driver

The piezo messages can be used to perform activities such as selecting output voltages, reading the strain gauge position feedback, operating open and closed loop modes and enabling force sensing mode. With a few exceptions, these messages are generic and apply equally to both single and dual channel units.

Where applicable, the target channel is identified in the IChanID parameter and on single channel units, this must be set to CHAN1_ID. On dual channel units, this can be set to CHAN1_ID, CHAN2_ID or CHANBOTH_ID as required.

For details on the operation of the Piezo Controller, and information on the principles of operation, refer to the handbook supplied with the unit.

MGMSG_PZ_SET_POSCONTROLMODE MGMSG_PZ_REQ_POSCONTROLMODE MGMSG_PZ_GET_POSCONTROLMODE 0x0640 0x0641 0x0642

Function:

When in closed-loop mode, position is maintained by a feedback signal from the piezo actuator. This is only possible when using actuators equipped with position sensing.

This method sets the control loop status The Control Mode is specified in the Mode parameter as follows:

0x01 Open Loop (no feedback)

0x02 Closed Loop (feedback employed)

0x03 Open Loop Smooth0x04 Closed Loop Smooth

If set to Open Loop Smooth or Closed Loop Smooth is selected, the feedback status is the same as above however the transition from open to closed loop (or vise versa) is achieved over a longer period in order to minimize voltage transients (spikes).

SET:

Command structure (6 bytes):

0	1	2	3	4	5			
header only								
40	06	Chan Mode		d	S

MGMSG_PZ_SET_PICONSTS MGMSG_PZ_REQ_PICONSTS MGMSG_PZ_GET_PICONSTS 0x0655 0x0656 0x0657

Function:

Used to set the proportional and integration feedback loop

constants. These parameters determine the response characteristics

when operating in closed loop mode.

The processors within the controller compare the required (demanded) position with the actual position to create an error, which is then passed through a digital PI-type filter. The filtered value is used to develop an output voltage to drive the piezo.

SET:

Command structure (12 bytes)

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
	header						Data				
55	06	06	00	d	S	Chan Ident PropConst IntCo			onst		

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
PropConst	The value of the proportional term in the range 0 to 255.	word
IntConst	The value of the Integral term.in the range 0 to 255	word

Example: Set the PI constants for a TPZ001 unit.

TX 55, 06, 06, 00, D0, 01, 01, 00, 64, 00, 0F, 00

Header: 55, 06, 05, 00, D0, 01: SetPIConsts, 06 byte data packet, Generic USB Device.

Chan Ident: 01, 00: Channel 1

PropConst: 64, 00: sets the proportional constant to 100

IntConst: OF, OO: sets the integral constant to 15

MGMSG_PZ_REQ_PZSTATUSBITS MGMSG_PZ_GET_PZSTATUSBITS 0x065B 0x065C

Function:

Returns a number of status flags pertaining to the operation of the piezo controller channel specified in the Chan Ident parameter. These flags are returned in a single 32 bit integer parameter and can provide additional useful status information for client application development. The individual bits (flags) of the 32 bit integer value are described in the following tables.

REQUEST:

Command structure (6 bytes):

MGMSG_PZ_GET_PZSTATUSUPDATE

0x0661

Function: This function is used in applications where spontaneous status

messages (i.e. messages sent using the START_STATUSUPDATES

command) must be avoided. There is no REQ message.

Status update messages contain information about the position and status of the controller (for example position and O/P voltage). The messages will be sent by the controller each time the function is

called.

GET:

Status update messages are received with the following format:-

Response structure (16 bytes)

MGMSG_PZ_ACK_PZSTATUSUPDATE

0x0662

Only Applicable If Using USB COMMS. Does not apply to RS-232 COMMS

Function: If using the USB port, this message called "server alive" must be sent

by the server to the controller at least once a second or the

controller will stop responding after ~50 commands.

The controller keeps track of the number of "status update" type of messages (e.g.move complete message) and it if has sent 50 of these without the server sending a "server alive" message, it will

stop sending any more "status update" messages.

This function is used by the controller to check that the PC/Server

has not crashed or switched off. There is no response.

Structure (6 bytes):

MGMSG_PZ_SET_OUTPUTLUT MGMSG_PZ_REQ_OUTPUTLUT MGMSG_PZ_GET_OUTPUTLUT 0x0700 0x0701 0x0702

Function:

It is possible to use the controller in an arbitrary Waveform Generator Mode (WGM). Rather than the unit outputting an adjustable but static voltage or position, the WGM allows the user to define a voltage or position sequence to be output, either periodically or a fixed number of times, with a selectable interval between adjacent samples.

This waveform generation function is particularly useful for operations such as scanning over a particular area, or in any other application that requires a predefined movement sequence. The waveform is stored as values in an array, with a maximum of 8000 samples per channel. The samples can have the meaning of voltage or position; if open loop operation is specified when the samples are output, then their meaning is voltage and vice versa, if the channel is set to closed loop operation, the samples are interpreted as position values. If the waveform to be output requires less than 8000 samples, it is sufficient to download the desired number of samples.

This function is used to load the LUT array with the required output waveform. The applicable channel is specified by the Chan Ident parameter

If only a sub set of the array is being used (as specified by the cyclelength parameter of the <u>SetOutputLUTParams</u> function), then only the first cyclelength values need to be set. In this manner, any arbitrary voltage waveform can be programmed into the LUT. Note. The LUT values are output by the system at a maximum bandwidth of 7KHz, e.g.500 LUT values will take approximately 71 ms to be clocked out and the full 8000 LUT values will take approximately 1.14 secs.

	Data										
	PostCycleRest OPTri			gStart	OPTrigWidth TrigRepCy			pCycle			

Data Structure:

field	description	format
Chan Ident	The channel being addressed	word
Mode	Specifies the output mode of the LUT waveform as follows. Values can be 'bitwise or'd together as required. 0x01 - OUTPUTLUT_CONTINUOUS – The waveform is output continuously (i.e. until a StopOPLUT command is received). 0x02 - OUTPUTLUT_FIXED – A fixed number of waveform cycles are output (as specified in the NumCycles parameter).	word
	The following values are not applicable to the TPZ001 unit because it has no triggering functionality. 0x04 - OUTPUTLUT_OUTPUTTRIG – Enables Output Triggering. With OP Triggering enabled, the system can be configured to generate one or more hardware trigger pulses during a LUT (waveform) cycle output, as specified in the OPTrigStart parameter below.	

Thorlabs Confidential Page 127 of 234

	Ox08 - OUTPUTLUT_INPUTTRIG —Enables Input Triggering. With INPUTTRIG set to 'False', the waveform generator will start as soon as it receives a StartOPLUT command. If however, INPUTTRIG is set to 'True, waveform generation will only start if a software command is received AND the trigger input is in its active state. In most cases, the trigger input will be used to synchronize waveform generation to an external event. In this case, the StartOPLUT command can be viewed as a command to "arm" the waveform generator and the waveform will start as soon as the input becomes active. The trigger input can be used to trigger a single channel or multiple channels. In this latter case ensure that input triggering is enabled on all the desired channels. Using the trigger input for multiple channels is particularly useful to synchronize all channels to the same event. Ox10 - OUTPUTLUT_OUTPUTTRIG_SENSE_HI – determines the voltage sense and edge of the O/P trigger. If this bit is set, the units responds to a rising edge (OV to 5V) trigger. If not set it responds to a falling edge (SV to OV). Ox20 - OUTPUTLUT_INPUTTRIG_SENSE_HI – determines the voltage sense and edge of the I/P trigger. If this bit is set, the units responds to a rising edge (OV to 5V) trigger. If not set it responds to a falling edge (SV to OV). Ox40 - OUTPUTLUT_LUTGATED – If set to '1' the trigger acts as a gate, if set to '0' acts as trigger. Ox80 - OUTPUTLUT_OUTPUTTRIG_REPEAT – This parameter is a flag which determines if repeated O/P triggering is enabled. If set, the output trigger is repeated by the interval set in the TrigRepeatCycle parameter. This is useful for multiple triggering during a single voltage O/P	
CycleLength	sweep. Specifies how many samples will be output in each cycle of the waveform. It can be set in the range 0 to 7999 for BPC and MPZ units, and 0 to 512 for TPZ units. It must be less than or equal to the total number of samples that were loaded. (To set the LUT array values for a particular channel, see the SetOutputLUT function).	word
NumCycles	Specifies the number of cycles (1 to 2147483648) to be output when the Mode parameter is set to fixed. If Mode is set to Continuous, the NumCycles parameter is ignored. In both cases, the waveform is not output until a StartOPLUT command is received.	long
DelayTime	Specifies the delay (in sample intervals) that the system waits after setting each LUT output value. By default, the time the system takes to output LUT values (sampling interval) is set at the maximum bandwidth possible, i.e. 7KHz (0.14 ms) for MPZ models, 1kHz(1.0 ms) for BPC and 4 kHz (0.25 ms) for TPZ units. The DelayTime parameter specifies the time interval between neighbouring samples, i.e. for how long the	long

Thorlabs Confidential Page 128 of 234

	sample will remain at its present value. To increase the time between samples, set the DelayTime parameter to the required additional delay (1 to 2147483648 sample intervals). In this way, the user can stretch or shrink the waveform without affecting its overall shape.	
PreCycleRest	In some applications, during waveform generation the first and the last samples may need to be handled differently from the rest of the waveform. For example, in a positioning system it may be necessary to start the movement by staying at a certain position for a specified length of time, then perform a movement, then remain at the last position for another specified length of time. This is the purpose of PreCycleRest and PostCycleRest parameters, i.e. they specify the length of time that the first and last samples are output for, independently of the DelayTime parameter. The PreCycleRest parameter allows a delay time to be set before the system starts to clock out the LUT values. The delay can be set between 0 and 2147483648 sample intervals. The system then outputs the first value in the LUT until the PreCycleRest time has expired.	long
PostCycleRest	In a similar way to PreCycleRest, the PostCycleRest parameter specifies the delay imposed by the system after a LUT table has been output. The delay can be set between 0 and 2147483648 sample intervals. The system then outputs the last value in the cycle until the PostCycleRest time has expired.	long
OPTrigStart	Output triggering is enabled by setting the value 0x04 in the MODE parameter. With Op Triggering enabled, the system can be configured to generate one or more hardware trigger pulses during a LUT (waveform) cycle output. The OPTrigStart parameter specifies the LUT value (position in the LUT array) at which to initiate an output trigger. In this way, it is possible to synchronize an output trigger with the output of a particular voltage value. Values are set in the range 1 to 8000 but must also be less than the CycleLength parameter.	word
OPTrigWidth	sets the width of the output trigger. Values are entered in 1ms increments for BPC20x models.	long
TrigRepeatCycle	specifies the repeat interval between O/P triggers when OUTPUTTRIG_REPEAT is set to True. This parameter is specified in the number of LUT values between triggers (0 to 7999 for MPZ and BPC units, 0 to 512 for TPZ units). If this value is greater than the ICycleLength parameter (set in the SetOPLUTParams method) then by definition, a repeated trigger will not occur during a single waveform cycle output.	word

Data Structure:

field	description	format
Chan Ident	The channel being addressed is always P_MOD_CHAN1	word
	(0x01) encoded as a 16-bit word (0x01 0x00)	
VoltageLimit	The piezo actuator connected to the T-Cube has a specific	word
	maximum operating voltage range. This parameter sets	
	the maximum output to the value specified as follows:	
	0x01 VOLTAGELIMIT_75V 75V limit	
	0x02 VOLTAGELIMIT_100V 100V limit	
	0x03 VOLTAGELIMIT_150V 150V limit	
HubAnalogInput	When the T-Cube Piezo Driver unit is used in conjunction	word
	with the T-Cube Strain Gauge Reader (TSG001) on the T-	
	Cube Controller Hub (TCH001), a feedback signal can be	
	passed from the Strain Gauge Reader to the Piezo unit.	
	High precision closed loop operation is then possible using	
	our complete range of feedback-equipped piezo actuators.	
	This parameter is used to select the way in which the	
	feedback signal is routed to the Piezo unit as follows:	
	0x01 HUB_ANALOGUEIN_A the feedback	
	signals run through all T-Cube bays.	
	0x02 HUB_ANALOGUEIN_B the feedback	
	signals run between adjacent pairs of T-Cube bays	
	(i.e. 1&2, 3&4, 5&6). This setting is useful when	
	several pairs of Strain Gauge/Piezo Driver cubes	
	are being used on the same hub.	
	0x03 EXTSIG_SMA the feedback signals run	
	through the rear panel SMA connectors.

MGMSG_PZ_SET_ZERO

0x0658

Function:

This function applies a voltage of zero volts to the actuator associated with the channel specified by the IChanID parameter, and then reads the position. This reading is then taken to be the zero reference for all subsequent position readings. This routine is typically called during the initialisation or re-initialisation of the piezo arrangement.

TX structure (6 bytes):

0	1	2	3	4	5

58	06	Chan	00	d	S
		Ident			

Thorlabs Confidential Page 136 of 234

MGMSG_PZ_REQ_MAXTRAVEL MGMSG_PZ_GET_MAXTRAVEL 0x0650 0x0651

Function:

In the case of actuators with built in position sensing, the Piezoelectric Control Unit can detect the range of travel of the actuator since this information is programmed in the electronic circuit inside the actuator. This function retrieves the maximum travel for the piezo actuator associated with the channel specified by the Chan Ident parameter, and returns a value (in microns) in the

Travel parameter.

REQ:

Command structure (6 bytes):

MGMSG_PZ_SET_IOSETTINGS MGMSG_PZ_REQ_IOSETTINGS MGMSG_PZ_GET_IOSETTINGS

0x0670 0x0671 0x0672

Function:

This function is used to set various I/O settings as described below. The settings can be saved (persisted) to the EEPROM by calling the

MGMSG_PZ_SET_EEPROMPARAMS function.

SET:

Command structure (16 bytes)

6 byte header followed by 10 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11		
		hea	ıder					D	ata				
70	06	0A	00	d	S	Chan Ident AmpCurrentLim AmpLPFili				LPFilter			

12	13	14	15				
	Data						
Feedb	ackSig	BNCTrig	ORLVOut				

Data Structure:

field	description	format
Chan Ident	The channel being addressed is always P_MOD_CHAN1	word
	(0x01) encoded as a 16-bit word (0x01 0x00)	
AmpCurrentLim	This parameter sets the maximum current output for the	word
	HV amplifier circuit as follows:	
	CURRENTLIMIT_100MA 0x00	
	CURRENTLIMIT_250MA 0x01	
	CURRENTLIMIT_500MA 0x02	
AmpLPFilter	This parameter sets the value of the hardware low pass	word
	filter applied to the HV amplifier output channels. It can	
	be used to improve stability and reduce noise on the HV	
	outputs. It is not channel specific and the Chan Ident	
	parameter is ignored for this particular setting. Values are	
	set as follows:	
	OUTPUTLPFILTER_10HZ 0x00	
	OUTPUTLPFILTER_100HZ 0x01	
	OUTPUTLPFILTER_5KHZ 0x02	
	OUTPUTLPFILTER_NONE 0x03	
FeedbackSig	For future use. The feedback signal type is locked at AC	
	(strain gauge) and cannot be changed at this time.	
BNCTrigORLVOut	The Control IO BNC connectors on the rear panel are dual	
	function. When set to Low Voltage (LV) outputs they	
	mirror the voltage on the Piezo drive HV connectors and	
	can be connected to an oscilloscope for monitoring	
	purposes. When set to Trigger mode they provide the	
	trigger input and output connections. This function is	
	used to set the mode of the rear panel BNC connectors as	
	follows:	
	BNCMODE_TRIG Trigger Output 0x0000	
	BNCMODE_LVOUT LV Output 0xFFFF

MGMSG_PZ_SET_TPZ_SLEWRATES MGMSG_PZ_REQ_TPZ_SLEWRATES MGMSG_PZ_GET_TPZ_SLEWRATES 0x0683 0x0684 0x0685

Function:

When stages with delicate internal mechanisms are being driven, it is possible that sudden large changes to the drive voltage could cause damage. This function is used to limit the rate of change of the drive voltage. Different limits may be set for open loop and closed loop operating modes.

Note. The controller is loaded at the factory with default values suitable for driving legacy piezo stages. For newer generation stages, the slew rate is read in automatically. Consequently, these parameters should not require adjustment under normal operating

conditions.

SET:

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
	header						Data				
83	06	06	00	d	S	Chan Ident SlewOpen SlewClos				Closed	

Data Structure:

field	description	format
Chan Ident	The channel being addressed.	word
SlewOpen	This parameter sets the maximum slew rate when operating in open loop mode. Values are set in the range 0 to 32767, where 0 disables the limit, and 1 is the slowest rate. Values are calculated in V/ms as follows: Slew Rate = Value x Max Voltage (i.e. 75, 100 or 150 V) 19000	word
SlewClosed	This parameter sets the maximum slew rate when	word
	operating in closed loop mode.	
	Values are calculated as above	

Example: Set the open and closed max slew rates to 10V/ms for a 150V piezo.

TX 83, 06, 06, 00, D0, 01, 01, 00, F2, 04, F2, 04

Header: 80, 06, 06, 00, D0, 01: Set_SlewRates, 06 byte data packet, d=D0 (i.e. 50 ORed with

Thorlabs Confidential Page 144 of 234

MGMSG_PZ_SET_LUTVALUETYPE:

0x0708

Function:

It is possible to use the controller in an arbitrary Waveform Generator Mode (WGM). Rather than the unit outputting an adjustable but static voltage or position, the WGM allows the user to define a voltage or position sequence to be output, either periodically or a fixed number of times, with a selectable interval between adjacent samples. This waveform generation function is particularly useful for operations such as scanning over a particular area, or in any other application that requires a predefined movement sequence.

The waveform is stored as values in an array, with a maximum of 8000 samples per channel. The samples can have the meaning of voltage or position; if open loop operation is specified when the samples are output, then their meaning is voltage and vice versa, if the channel is set to closed loop operation, the samples are interpreted as position values. If the waveform to be output requires less than 8000 samples, it is sufficient to download the desired number of samples.

This message specifies whether the samples output from the LUT are voltage or position values.

TX structure (6 bytes):

0	1	2	3	4	5
		heade	r only		
08	07	LUTType	00	d	S

Data Structure:

field	description	format
LUTType	The LUT value type:	char
	0x01 LUT values are Voltage	
	0x02 LUT values are position	

Example: Set the LUT value type to Volts.

TX, 08,07,01,00,50,01

Notes on using this message.

This method must be called BEFORE the LUT values are downloaded.

The LUT values are scaled to either voltage or position while the LUT is being downloaded. If the value type needs to be changed during operation (e.g. the system was in open loop with volts type selected, but now needs to change to closed loop with position type) the message must be called again, and the LUT values downloaded again.

NanoTrak Control Messages

Introduction

The 'NanoTrak' ActiveX Control provides the functionality required for a client application to control one or more NanoTrak auto-alignment controller products. The NanoTrak system comes in benchtop (BNT001), T-Cube (TNA001) and 19" rack modular (MNA601) formats, all of which are covered by the NanoTrak ActiveX Control.

The messages of the NanoTraks object can then be used to perform activities such as latching/unlatching, reading power levels, obtaining/setting circle size and position and determining if 'NanoTracking' is currently taking place.

For details on the use of the NanoTrak controller, and information on the principles of operation, refer to the NanoTrak Operating Guide.

Thorlabs Confidential Page 149 of 234

MGMSG_PZ_SET_NTMODE

0x0603

Function:

The NanoTrak unit can be used as a standard piezo amplifier, or as a NanoTrak Auto-alignment unit. This message sets the unit to piezo operation, or one of the NanoTrak operating modes as described below. The mode of operation is set in byte 2 of the message as follows:

SET:

Command structure (6 bytes):

0	1	2	3	4	5
		head	ler only		
03	06	State	00	d	S

Data Structure:

field	description	format
State	01 Sets the unit to Piezo mode.	short
	Note . The hardware unit must be rebooted before changes	
	to operating mode can take effect.	
	Note . When the HW operating mode of a NanoTrak unit has	
	been changed to Piezo operation, then the Piezo ActiveX	
	control must be used to communicate with the unit. Use the	
	same serial number as used on the NanoTrak control in	
	order to establish communication with the unit.	
	02 Latch mode. In this mode, scanning is disabled and	
	the piezo drives are held at the present position.	
	03 Track mode. In this mode, the NanoTrak detects any	
	drop in signal strength resulting from misalignment of the	
	input and output devices, and makes vertical and horizontal	
	positional adjustments to maintain the maximum	
	throughput.	
	04 Horizontal Track mode. In this mode, the NanoTrak	
	detects any drop in signal strength resulting from	
	misalignment of the input and output devices, and makes	
	horizontal positional adjustments to maintain the maximum	
	throughput.	
	05 Vertical Track mode. In this mode, the NanoTrak	
	detects any drop in signal strength resulting from	
	misalignment of the input and output devices, and makes	
	vertical positional adjustments to maintain the maximum	
	throughput.	

Example: Set the tracking mode to Latch

	power set by the user in the <u>Set_NTTrackThreshold</u>	
	message.	
	04 Tracking ON, Signal Attained. In this mode, the	
	threshold power has been detected and the NanoTrak is	
	tracking normally.	
Mode	The Tracking Mode.	
	01 Dual axis (X and Y) tracking.	
	02 Horizontal (X) axis tracking.	
	03 Vertical (Y) axis tracking.	

Example

TX 05, 06, 04, 01, 01, 50

Mode is Tracking Signal (0x04) and dual axis (Both X and Y tracking) (0x01)

Thorlabs Confidential Page 151 of 234

MGMSG_PZ_SET_NTTRACKTHRESHOLD MGMSG_PZ_REQ_NTTRACKTHRESHOLD MGMSG_PZ_GET_NTTRACKTHRESHOLD 0x0606 0x0607 0x0608

Function:

This message sets the tracking threshold of the NanoTrak. The value is set in Amps, and is dependent upon the application. Typically, the value is set to lie above the 'noise floor' of the particular physical arrangement. When the input signal level exceeds this value, the tracking LED is lit on the GUI panel. Note there is no guarantee that tracking is taking place if this threshold value is set inappropriately. E.g. if the tracking threshold is set to below the noise floor, then the GUI will show a lit tracking LED even though no tracking is taking place.

10	11	12	13	14	15	16	17	18	19	
					Data	nta				
	AbsRe	ading		RelRe	ading	Range UnderOverRead				

Data Structure:

field	description	format
CircPosA	The horizontal co-ordinate of the circle home position, in	word
	the range 0 to 65535 (0 to 100% of output voltage or 0 to	
	10 NanoTrak units).	
CircPosB	The vertical co-ordinate of the circle home position, in the	word
	range 0 to 65535 (0 to 100% of output voltage or 0 to 10	
	NanoTrak units).	
AbsReading	The absolute TIA (PIN) current or BNC voltage value at the	float
	current position. The value is returned as a 4 byte floating	
	point value in the range 1 x 10^{-9} to 1 x 10^{-3} (i.e. 1 nA to 1	
	mA or 1 to 10 V). The input source, TIA or BNC is set in the	
	Set_NTFeedbackSRC message.	
RelReading	The relative signal strength at the current position, in the	word
	range 0 to 32767 (i.e. 0 to 100% of the range currently	
	selected). This value matches the length of the input signal	
	bargraph on the GUI panel. (e.g. if the 3 μA range is	
	currently selected, then a RelReading value of 16384 (50%)	
	equates to 1.5 μA).	
Range	The NanoTrak unit is equipped with an internal trans-	word
	impedance amplifier (TIS) circuit (and associated	
	range/power level displays and control buttons in the	
	GUI). This amplifier operates when an external input signal	
	is connected to the Optical/PIN connector on the rear	
	panel. There are 14 range settings (1 - 14) that can be used	
	to select the best range to measure the input signal

MGMSG_PZ_SET_NTCIRCPARAMS MGMSG_PZ_REQ_NTCIRCPARAMS MGMSG_PZ_GET_NTCIRCPARAMS 0x0618 0x0619 0x0620

Function: This message obtains sets various scanning circle parameters as

described below.

SET:

Command structure (18 bytes)

6 byte header followed by 12 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9
		hea	der	Data					
18	06	0C	00	d	S	CircDia	Mode	CircDi	aSW
10	11	12	1	13	14	15	16	17	
Data									
CircOs	CircOscFreq AbsPwrMinCircDia AbsPwrMaxCircDia AbsPwrAdjustType								/pe

Data Structure:

field	description	format
CircDiaMode	This parameter allows the different modes of circle diameter adjustment to be enabled and disabled as follows:	word
	0x01 NTCIRCDIA_SW the circle diameter remains at the value set using the CircDiaSW parameter	
	below. 0x02 NTCIRCDIA_ABSPWR the circle diameter is set by absolute power input value (depending on adjustment algorithm selected in the AbsPwrAdjustType	
	parameter - see below) 0x03 NTCIRCDIA_LUT the circle diameter is adjusted automatically, using a table of TIA range dependent values (set using the SetCircDiaLUT message.	
CircDiaSW	This parameter sets the NT circle diameter if NTCIRCDIA_SW (0x01) is selected in the CircDiaMode parameter above. The diameter is set in the range 0 to 65535, which relates to 0% to 100% output voltage –(i.e. 0 to 10 NT units).	word
CircOscFreq	This parameter contains the number of samples taken in one revolution of the scanning circle and is used to set the scanning frequency of the NanoTrak circle. The circle scanning frequency lies in the range 17.5 Hz to 87.5 Hz for TNA001 and 20 Hz to 190 Hz for the BNT001. The factory default setting for the scanning frequency is 43.75Hz. This means that a stage driven by the NanoTrak makes 43.75 circular movements per second. Different frequency settings allow more than one NanoTrak to be used in the same alignment scenario. The scanning frequency is derived from the NanoTrak sampling frequency of 7000 Hz and the CircOscFreq	word

Thorlabs Confidential Page 157 of 234

Thorlabs APT Controllers

	value which is calculated as follows:	
	CircOscFreq = 7000 / scanning frequency	
	Note . The CircOscFreq parameter must be entered as a	
	multiple of '4'.	
AbsPwrMinCircDia	The minimum circle diameter. Applicable only if the	word
	CircDiaMode parameter above is set to	
	NTCIRCDIA_ABSPWR (0x02). The diameter is set in the	
	range 0 to 32767, which relates to 0% to 50% output	
	voltage –(i.e. 0 to 5 NT units).	
AbsPwrMaxCircDia	The maximum circle diameter. Applicable only if the	word
	CircDiaMode parameter above is set to	
	NTCIRCDIA_ABSPWR (0x02). The diameter is set in the	
	range 0 to 32767, which relates to 0% to 50% output	
	voltage –(i.e. 0 to 5 NT units).	
AbsPwrAdjustType	This parameter sets the adjustment type and is	word
	applicable only if CircDiaMode parameter above is set to	
	NTCIRCDIA_ABSPWR (0x02).	
	0x01 NTABSPWRCIRCADJUST_LIN inverse linear	
	adjustment	
	0x02 NTABSPWRCIRCADJUST_LOG inverse log	
	adjustment	
	0x03 NTABSPWRCIRCADJUST_X2 inverse square	
	adjustment	
	0x04 NTABSPWRCIRCADJUST_X3 inverse cube	
	adjustment

MGMSG_PZ_SET_NTCIRCDIALUT MGMSG_PZ_REQ_NTCIRCDIALUT MGMSG_PZ_GET_NTCIRCDIALUT 0x0621 0x0622 0x0623

Function:

This message enables a look up table (LUT) of circle diameter values to be specified as a function of input range. When automatic LUT diameter adjustment mode is enabled (using the CircDiaMode parameter in the Set NTCircParams message), the system uses values in this LUT to modify circle diameter in relation to the input range currently selected.

This LUT diameter adjustment mode allows appropriate circle diameters to be applied on an application specific basis.

SET:

Command structure (38 bytes)

6 byte header followed by 32 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11

MGMSG_PZ_SET_NTPHASECOMPPARAMS MGMSG_PZ_REQ_NTPHASECOMPPARAMS MGMSG_PZ_GET_NTPHASECOMPPARAMS 0x0626 0x0627 0x0628

Function:

The feedback loop scenario in a typical NanoTrak application can involve the operation of various electronic and electromechanical components (e.g. power meters and piezo actuators) that could introduce phase shifts around the loop and thereby affect tracking efficiency and stability. These phase shifts can be cancelled by setting the 'Phase Compensation' factors.

This message sets the phase compensation for the horizontal and vertical components of the circle path in the range 0 to 360 degrees. Typically both phase offsets will be set the same, although some electromechanical systems may exhibit different phase lags in the different components of travel and so require different values.

SET: Command structure (10 bytes)

6 byte header followed by 4 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
		hea	ıder			Data					
26	06	06	00	d	S	PhaseCompMode PhaseC			mpASW	PhaseCo	mpBSW

Data Structure:

field	description	format
PhaseCompMode	Currently, the phase compensation mode is not	word
	adjustable, and is locked at manual (software)	
	adjustment.	
PhaseCompASW	The horizontal axis phase compensation value, entered in	short
	real world units and calculated as follows:-	
	value = (phase angle [degrees] / 360) * CircOscFreq	
	See the PZ_SET_NTCIRCPARAMS message for details on	
	the CircOscFreq parameter	
	Note . Negative phase values must be made positive by	
	subtraction from 360 before the calculation is made.	
PhaseCompBSW	The vertical axis phase compensation value, entered in	short
	real world units and calculated as follows:-	
	value = (phase angle [degrees] / 360) * CircOscFreq	
	See the PZ_SET_NTCIRCPARAMS message for details on	
	the CircOscFreq parameter	
	Note . Negative phase values must be made positive by	
	subtraction from 360 before the calculation is made.	

Example: Set the NanoTrak circle home position to be screen centre.

TX 26, 06, 06, 00, D0, 01, 02, 00, 93, 00, 93, 00

MGMSG_PZ_SET_NTTIARANGEPARAMS MGMSG_PZ_REQ_NTTIARANGEPARAMS MGMSG_PZ_GET_NTTIARANGEPARAMS 0x0630 0x0631 0x0632

Function:

This message is used to select manual (software) or auto ranging, and to modify the ranging characteristics in each case.

SET:

Command structure (18 bytes)

6 byte header followed by 12 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9			
		hea	ıder			Da	ıta					
30	06	0C	00	S	RangeMode RangeUpLimit							
10	11	12	12 13		14	15	16	17				
Rangel	DownLim	it Se	ttleSamp	oles	RangeCha	ngeType	R	angeSW				

Data Structure:

field	description	format
RangeMode	This parameter specifies the ranging mode of the unit as	word
	follows:	
	0x01 RANGE_AUTO change to Auto ranging	
	at the range currently selected	
	0x02 RANGE_SW change to manual	
	ranging at the range currently selected	
	0x03 RANGE_SWSET change to manual	
	ranging at the range set in the SetRange method (or the	
	'Settings' panel)	
	0x04 RANGE_AUTOSET change to Auto ranging	
	at the range set in the RangeSW parameter below.	
RangeUpLimit	Only applicable if Auto Ranging is selected in the	short
	RangeMode parameter above.	
	This parameter sets the upper range limit as a	
	percentage of the present range, 0 to 1000 = 0 to 100%.	
	When autoranging, the NanoTrak unit adjusts	
	continually the TIA range as appropriate for the input	
	signal level. When the relative signal rises above the	
	limit specified in this parameter, the unit increments the	
	range to the next higher setting.	
	The relative signal is displayed on the NanoTrak GUI	
	panel by a green horizontal bar.	
RangeDownLimit	Only applicable if Auto Ranging is selected in the	short
	RangeMode parameter above.	
	This parameter sets the lower range limit as a	
	percentage of the present range, 0 to 1000 = 0 to 100%.	
	Similarly to RangeUpLimit, when the relative signal on a	
	particular range drifts below the limit set in this	
	parameter, the NanoTrak unit decrements the range to	
	the next lower setting.	

Thorlabs Confidential Page 165 of 234

	The relative signal is displayed on the NanoTrak GUI	
	panel by a green horizontal bar.	
SettleSamples	Only applicable if Auto Ranging is selected in the	short
	RangeMode parameter above.	
	This parameter determines the amount of averaging	
	applied to the signal before autoranging takes place.	
	Higher SettleSamples values improve the signal to noise	
	ratio when dealing with noisy feedback signals.	
	However, higher SettleSamples values also slow down	
	the autoranging response. In a particular application, the	
	SettleSamples value should be adjusted to obtain the	
	best autoranging response combined with a noise free	
	signal.	
	Values are set in real world units, from '2' to '32', with a	
	default setting value of '4'.	
RangeChangeType	Only applicable if Auto Ranging is selected in the	word
	RangeMode parameter above.	
	This parameter specifies how range changes are	
	implemented by the system.	
	0x01 AUTORANGE_ALL the unit visits all ranges	
	when ranging between two input signal levels.	
	0x02 AUTORANGE_ODD only the odd numbered	
	ranges between the two input signals levels will be	
	visited.	
	0x03 AUTORANGE_EVEN only the even numbered ranges between the two input signals levels will be	
	visited.	
	These latter two modes are useful when large rapid	
	input signal fluctuations are anticipated, because the	
	number of ranges visited is halved to give a more rapid	
	response.	
RangeSW	Only applicable if Manual (SW) Ranging is selected in the	word
	RangeMode parameter above.	
	The NanoTrak unit is equipped with an internal trans-	
	impedance amplifier (TIA) circuit (and associated	
	range/power level displays and control buttons in the	
	GUI). This amplifier operates when an external input	
	signal is connected to the Optical/PIN connector on the	
	rear panel. There are 14 range settings (1 - 14) that can	
	be used to select the best range to measure the input	
	signal (displayed on the GUI panel relative input signal	
	bar and display).	
	Note. Range 1 and 2 (3 nA and 10 nA) are not applicable	
	to TNA001 T-Cube units.	
	This parameter returns the input signal range currently	
	selected, defined as follows:	
	Range 1 3 nA 0x03	
	Range 2 10 nA 0x04 Range 3 30 nA 0x05	
	Range 3 30 nA 0x05 Range 4 100 nA 0x06	
	Range 5 300 nA 0x07	
	Marige 3 300 HA UXU7

MGMSG_PZ_SET_NTGAINPARAMS MGMSG_PZ_REQ_NTGAINPARAMS MGMSG_PZ_GET_NTGAINPARAMS 0x0633 0x0634 0x0635

Function:

This message sets the gain level of the NanoTrak control loop, and is used to ensure that the DC level of the input (feedback loop) signal lies within the dynamic range of the input. Increasing this value can lead to a more responsive NanoTrak behaviour as the signal variation around the circular path is enhanced. However, for a particular set up, if this value is too high, then unstable NanoTrak operation (indicated by a fluctuating circle) can result.

SET:

Command structure (10 bytes)

6 byte header followed by 4 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9
		hea	ıder		Da	ıta

MGMSG_PZ_SET_NTTIALPFILTERPARAMS MGMSG_PZ_REQ_NTTIALPFILTERPARAMS MGMSG_PZ_GET_NTTIALPFILTERPARAMS 0x0636 0x0637 0x0638

Function:

This message specifies the cut off frequency of the digital low pass (LP) filter applied to output readings of the internal amplifier (TIA) circuitry. If the readings displayed or returned are unstable, this setting can be used to remove any unwanted high frequency components and improve input signal stability.

SET:

Command structure (26 bytes)

6 byte header followed by 20 byte data packet as follows:

	0	1	2	3	4	5	6	7	8	9	10	11	12	13
Ī	header							Data

14	15	16	17	18	19	20	21	22	23	24	25	
	Data											
	Para	am3			Para	m4		Param5				

Data Structure:

field	description	format
FilterParams	This parameter contains low pass filter values which can be	long
	applied to the OUTPUT from the TIA, i.e. is applied to those	
	reading params sent to the PC. It does NOT operate on the	
	input to the TIA and does not operate on reading values	
	used by the NanoTrak algorythms (these use a bandpass	
	filter, effectively negating the need for a LP filter).	
	The filter can be used to smooth out readings displayed in	
	the GUI. It can also be used by client applications without	
	affecting operation of the NanoTrak.	
	Note . Although there are 5 parameters available, only the	
	first parameter is used at this time.	
	The filter can be set to OFF, or one of 5 frequency values as	
	follows:	
	Note. Only the first parameter is used at this time.	
	0 LP_NONE Low pass filter inactive	
	1 LP_1HZ Cut off all signals above 1Hz	
	2 LP_3HZ Cut off all signals above 3Hz	
	3 LP_10HZ Cut off all signals above 10Hz	
	4 LP_30HZ Cut off all signals above 30Hz	
	5 LP_100HZ Cut off all signals above 100Hz	

Example: Set the LP filter to 1 Hz.

MGMSG_PZ_SET_NTFEEDBACKSRC MGMSG_PZ_REQ_NTFEEDBACKSRC MGMSG_PZ_GET_NTFEEDBACKSRC 0x063B 0x063C 0x063D

Function:

This message sets the input source of the NanoTrak.

The INPUT_BNC settings are used when NanoTraking to optimise a voltage feedback signal. Typically, these inputs are selected when an external power meter which generates a voltage output, is connected to the rear panel SIG IN connector.

Note. In this case the internal amplifier circuit is bypassed and the 'Range' bar on the GUI panel is switched off (autoranging functionality is not required). Furthermore, although tracking occurs as normal, the tracking indicator on the GUI panel is inoperative.

The INPUT_TIA setting is used when NanoTraking to optimise a PIN current feedback signal. The TIA (trans impedence amplifier) input source should be selected when using the rear panel OPTICAL/PIN I/P connector with either an integral detector, or an external detector head connected to the optional SMB adapter. This option uses the internal amplifier circuit and associated functionality (e.g. autoranging).

SET: Command structure (6 bytes)

0	1	2	3	4	5
3B	06	00	00	d	S

The input source is set in byte 2 as follows:

0x01	HA input
0x02	BNC input (1V range)
0x03	BNC input (2V range)
0x04	BNC input (5V range)
0x05	BNC input (10V range)
	0x03 0x04

Example: Set the input source to TIA input.

MGMSG_PZ_ACK_NTSTATUSUPDATE

0x0666

Only Applicable If Using USB COMMS. Does not apply to RS-232 COMMS

Function: If using the USB port, this message called "server alive" must be sent

by the server to the controller at least once a second or the

controller will stop responding after ~50 commands.

The controller keeps track of the number of "status update" type of messages (e.g.move complete message) and it if has sent 50 of these without the server sending a "server alive" message, it will

stop sending any more "status update" messages.

This function is used by the controller to check that the PC/Server

has not crashed or switched off. There is no response.

Structure (6 bytes):

0	1	2	3	4	5					
header only										
66	06	00	00	d	S					

TX 66, 06, 00, 00, 50, 01

Laser Control Messages

Introduction

The 'Laser' ActiveX Control provides the functionality required for a client application to control one or more T-Cube Laser Sources.

The methods of the Laser Control Object can then be used to control the T-Cube Laser Source and Laser Driver units, and activities such as switching between display modes, setting the laser power set point, reading the laser power or current and setting the LED display intensity can be performed.

For details on the use of the Laser Source, refer to the handbook supplied with the unit.

Thorlabs Confidential Page 186 of 234

MGMSG_LA_SET_PARAMS MGMSG_LA_REQ_PARAMS MGMSG_LA_GET_PARAMS 0x0800 0x0801 0x0802

Function:

This generic parameter set/request message is used to control all the functionality of the TLS001. The specific parameters to control are identified by the use of sub-messages. These sub messages comply with the general format of the APT message protocol but rather than having a unique first and second byte in the header carrying the "message identifier" information, the first and second byte remain the same.

Instead, for the SET and GET messages, the message identifier is carried in the first two bytes in the data packet part of the message, whilst for the REQ message it is encoded as the third byte of the header.

Likewise, when the TLS001 responds, the first two bytes of the response remain the same and the first two bytes of the data packet identify the sub-message to which the information returned in the remaining part of the data packet relates.

The following sub messages are applicable to the TLS001:

Set/Request/Get Laser Power Setpoint (sub-message ID = 1)
Request/Get Laser Current and Power (sub-message ID = 3)
Set/Request/Get Laser Power Control Source (sub-message ID = 5)
Request/Get Status Bits (sub-message ID = 7)
Request/Get Maximum Limits (sub-message ID = 9)
Set/Request/Get Display Settings (sub-message ID = 11)

To explain the principle, the following examples describe the first of these messages in more detail.

Example - Set/Request/Get Laser Power Setpoint (sub-message ID = 1)

This sub-command is used to set / read the laser power setpoint. The setpoint is the required laser power that the TLS001 will attempt to maintain. This is not necessarily the same as the actual laser power because if the current limit for the laser diode is exceeded, the setpoint will not be reached.

SET:

Command structure (10 bytes)

6 byte header followed by 4 byte data packet as follows:

0	1	2	3	4	5	6 7 8 9			
		hea	ıder	Data					
00	08	04	00	d	S	MsgID SetPoir		oint	

Thorlabs Confidential Page 187 of 234

Data Structure:

field	description	format
MsgID	The message ID of the message containing the parameters	word
SetPoint	The Laser power setpoint (0 to 32767 -> 0% to 100% power).to be saved.	word

Example: Set the laser power setpoint to be set to 5% of the maximum power

TX 00, 08, 04, 00, D0, 01, 01, 00, 66, 06,

Header: 00, 08, 04, 00, D0, 01: Set_PARAMS, 04 byte data packet, Generic USB Device.

MsgID: 01, 00: Set Laser Power Setpoint

SetPoint:.66, 06: the laser power setpoint, 0x0666 (1638 decimal), which is 5 % of the full

power.

REQUEST:

See SET message for data structure

Thorlabs Confidential Page 188 of 234

Example - Request/Get Laser Current and Power (sub-message ID = 3)

This sub-command is used to read the actual laser power and the laser current. Note that there is no SET message as only the setpoint power can be set, not the actual power or current.

REQUEST:

Command structure (6 bytes):

0	0 1 2 3 4									
	header only									
01	01 08 03 00 d s									

TX 01, 08, 03, 00, 50, 01,

GET:

Command structure (12 bytes)

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
		hea	ıder			Data					
02	08	06	00	d	S	MsgID LaserCurrent Lase			Laserl	Power	

Data Structure:

field	description	format
MsgID	The message ID of the message containing the parameters	word
LaserCurrent	The Laser current (0 to 32767 -> 0 to max current in mA)	word
LaserPower	The Laser power (0 to 32767 -> 0% to 100% power)	word

Example: Get the laser current and power

RX 02, 08, 06, 00, D0, 01, 03, 00, 66, 06, 66, 06

Header: 00, 08, 06, 00, D0, 01: Set_PARAMS, 06 byte data packet, Generic USB Device.

MsgID: 03, 00: Get Laser Current and Power

LaserCurrent: .66, 06: the laser current, 0x0666 (1638 decimal), which is 5 mA for a 100 mA

max current laser.

LaserPower:.66, 06: the laser power, 0x0666 (1638 decimal), which is 5% of the full power.

Thorlabs Confidential Page 189 of 234

Example - Set/Request/Get the Laser Power Control Source (sub-message ID = 5)

This sub-command is used to set / read the laser power control source. The laser power can be controlled by APT commands, the potentiometer on the top of the unit or the external SMA input. Only one control source can be active at any time, the options are mutually exclusive.

SET:

Command structure (10 bytes)

6 byte header followed by 4 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9

Thorlabs Confidential Page 190 of 234

Request/Get Status Bits (sub-message ID = 7)

This sub command can be used to request the TLS001 status bits. The message only has a request/get part.

REQUEST:

Command structure (6 bytes):

0	1	2	3	4	5					
	header only									
01	01 08 07 00 d									

TX 01, 08, 07, 00, 50, 01,

GET:

Status update messages are received with the following format:-

Response structure (12 bytes)

6 byte header followed by 6 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11
	header							Data			
02	08	06	00	d	S	Ms	MsgID StatusBits				

Data Structure:

field	description	format
MsgID	The message ID of the message containing the parameters	word
StatusBits	The meaning of the individual bits (flags) of the 32 bit integer value will depend on the controller and are	dword
	described in the following tables.	

TLS001 controller

Hex Value	Bit Number	Description
0x0000001	1	Laser output enabled state (1 - enabled, 0 - disabled).
0x00000002	2	Keyswitch enabled state (1 - enabled, 0 – disabled)
0x00000004	3	Laser control mode (1 - power [closed loop], 0 - current [open loop])
0x00000008	4	Safety interlock, (1 - enabled, 0 – disabled)
0x00000010	5	Units mode (1 - mA, else 0).
0x00000020	6	Units mode (1 - mW, else 0).
0x00000040	7	Units mode (1 - dBm, else 0)
	8	For Future Use

Example

RX 02, 08, 06, 00, 81, 50, 07, 00, 2B, 00, 00, 00

Header: 02, 08, 06, 00, 81, 50: LA_Get_Params, 06 byte data packet, Generic USB Device.

MsgID: 07, 00: Get Status Bits

StatusBits: 2B,00,00,00, i.e. 00101011 the display shows mW units, the safety interlock is

enabled, the keyswitch is enabled and the output is enabled.

Thorlabs Confidential Page 191 of 234

Request/Get Maximum Limits (sub-message ID = 9)

This sub command can be used to request the TLS001 maximum limits, such as maximum current, maximum power and the wavelength of the laser diode. The message only has a request/ get part.

REQUEST:

Command structure (6 bytes):

0	1	2	3	4	5					
header only										
01	08	09	00	d	S					

TX 01, 08, 09, 00, 50, 01,

GET:

Status update messages are received with the following format:-

Response structure (14 bytes)

6 byte header followed by 8 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11	12	13
	header						Data						
02	08	08	00	d	S	MsgID		MsgID MaxCurrent MaxPower		ower	Wavel	length	

Data Structure:

field	description	format
MsgID	The message ID of the message containing the parameters	word
MaxCurrent	The Laser max current (0 to 65535 -> 0 to 655.35 mA)	word
MaxPower	The Laser max power (0 to 65535 -> 0 to 6.5535 mW)	word
WaveLength	The Laser wavelength in nm (635 or 1550)	word

Example – Get Laser Limits

RX 02, 08, 08, 00, D0, 01, 09, 00, C8, 00, 05, 00, 0E, 06

Header: 00, 08, 06, 00, D0, 01: Set PARAMS, 06 byte data packet, Generic USB Device.

MsqID: 09, 00: Get Laser Max Limits

MaxCurrent:.C8, 00:, 0x00C8 i.e. 200mA max current. *MaxPower*:.05, 00:, 0x0005 i.e. 5 mW max power.

Wavelength: .0E, 06: the laser power, 0x060E (1550 decimal), wavelength 1550 nm.

Thorlabs Confidential Page 196 of 234

MGMSG_LA_ACK_STATUSUPDATE

0x0822

Only Applicable If Using USB COMMS. Does not apply to RS-232 COMMS

Function: If using the USB port, this message called "server alive" must be sent

by the server to the controller at least once a second or the

controller will stop responding after ~50 commands.

The controller keeps track of the number of "status update" type of messages (e.g. move complete message) and it if has sent 50 of these without the server sending a "server alive" message, it will

stop sending any more "status update" messages.

This function is used by the controller to check that the PC/Server

has not crashed or switched off. There is no response.

Quad Control Messages

Introduction

The 'Quad' ActiveX Control provides the functionality required for a client application to control one or more T-Cube Quad Detector Readers.

The methods of the Quad Control Object can then be used to control the T-Cube Quad Reader, and activities such as switching between Monitor, Open Loop and Closed Loop operating modes, setting the position demand parameters, reading the present beam position and setting the LED display intensity.

For details on the use of the T-Cube Quad Detector Reader, refer to the handbook supplied with the unit.

Thorlabs Confidential Page 198 of 234

MGMSG_QUAD_SET_PARAMS MGMSG_QUAD_REQ_PARAMS MGMSG_QUAD_GET_PARAMS 0x0870 0x0871 0x0872

Function:

This generic parameter set/request message is used to control the functionality of the TQD001. The specific parameters to control are identified by the use of sub-messages. These sub messages comply with the general format of the APT message protocol but rather than having a unique first and second byte in the header carrying the "message identifier" information, the first and second byte remain the same.

Instead, for the SET and GET messages, the message identifier is carried in the first two bytes in the data packet part of the message, whilst for the REQ message it is encoded as the third byte of the header.

Likewise, when the TQD001 responds, the first two bytes of the response remain the same and the first two bytes of the data packet identify the sub-message to which the information returned in the remaining part of the data packet relates.

The following sub messages are applicable to the TLS001:

Set/Request/Get Quad_LoopParams (sub-message ID = 01)

Request/Get Quad_Readings (sub-message ID = 03)

Set/Request/Get Quad Position Demand Params (sub-message ID = 05)

<u>Set/Request/Get Quad Operating Mode (sub-message ID = 07)</u>

Request/Get Quad Status Bits (sub-message ID = 09)

Set/Request/Get Quad Display Settings (sub-message ID = 0B)

Set/Request/Get Quad Position Demand Outputs (sub-message ID = 0D)

To explain the principle, the following examples describe these messages in more detail.

Set/Request/Get Quad_LoopParams (sub-message ID = 01)

Used to set the proportional, integration and differential feedback loop constants to the value specified in the PGain, IGain and DGain parameters respectively. They apply when the quad detector unit is operated in closed loop mode, and position demand signals are generated at the rear panel SMA connectors by the feedback loops. These position demand voltages act to move the beam steering elements (e.g. a piezo driven mirror) in order to centralize a beam at the centre of the PSD head.

When operating in closed loop mode, the proportional, integral and differential (PID) constants can be used to fine tune the behaviour of the dual feedback loops to adjust the response of the position demand output voltages. The feedback loop parameters need to be adjusted to suit the different types of sensor that can be connected to the system. The default values have been optimized for the PDQ80A sensor.

Thorlabs Confidential Page 200 of 234

Request/Get Quad_Readings (sub-message ID = 3)

The TQD001 Quad Detector T-Cube has been designed to operate with the PDQ80A Quad Detector. The detector consists of a 4-segment photodiode sensor array, which provides 'Bottom minus Top' (YDIFF) and 'Left minus Right' (XDIFF) difference signals, together with the SUM of the signals (total beam power) from all four quadrants of the photodiode array. This sub-message is used to read the actual SUM, XDIFF and YDIFF signals from the detector. Whether these signals are routed to the LV OUT/XDIFF and LV OUT/YDIFF SMA connectors on the rear panel depends on the operating mode selected (see the Quad OperMode message) as follows.

In 'Closed Loop' mode, the signal from the detector is interpreted by the unit, and the feedback circuit sends position demand signals (XOut and YOut) to the rear panel LV OUT/XDIFF and LV OUT/YDIFF connectors, which can be used to drive a pair of positioning elements (e.g. piezo controllers) in order to position the light beam within the center of the detector array. This submessage is then used to read the actual values for the XPos and YPos position demand signals (-10 V to +10V). Note that in closed loop mode, with the beam central, the X and Y axis difference outputs from the photodiode array are zero. However, the position demand signals on the rear panel LV OUT XDIFF and YDIFF SMA connectors are whatever value is necessary to drive the positioning elements to centre the beam.

When the Quad Detector T-Cube is operated in 'open loop' mode, the signals on the rear panel LV OUT/XDIFF and LV OUT/YDIFF connectors are constant. They are either fixed at zero (0V), or held at the last Closed Loop value (depending on the 'QuadPosDemandParams' message. This is useful when the system is being adjusted manually, to position the light beam within the detector array.

When operating in 'Monitor' mode, the X axis (XDIFF) and Y axis (YDIFF) difference signals from the detector, are fed through to the rear panel SMA connectors for use in a monitoring application.

					Do	ıta						
XPosDe	emMax	YPosDe	emMax	LVOut	Route	OLPosDem XPosFB			3Sense	YPosFBSense		

Data Structure:

field	description	format
SubMsgID	The message ID (i.e. 0500) of the message containing the parameters	word
XPosDemandMin	The following four parameters are applicable only when operating in closed loop mode. The XOut and YOut values are the low voltage signals sent to the LV OUT/XDIFF and LV OUT/YDIFF connectors, which are then used to drive the positioning mechanism in order to keep the beam central in the detector. Under normal operating conditions, these values are between -10 V and +10 V, however some applications may require the limits to be less than this. The XPosDemandMin parameter is used to set the min limit for the XOut value, between -10V and +10V. (i.e32768 to 32767)	short
YPosDemandMin	As above. The YPosDemandMin parameter is used to set the min limit for the YOut value, between -10V and +10V. (i.e32768 to 32767)	short
XPosDemandMax	As above. The XPosDemandMax parameter is used to set the max limit for the XOut value, between -10V and +10V. (-32768 to 32767)	short
YPosDemandMax	As above. The YPosDemandMax parameter is used to set the max limit for the YOut value, between -10V and +10V. (-32768 to 32767)	short
LVOutRoute	When operating in closed loop mode, the Quad Detector position control signals are always output on the external SMA connectors (LV OUT XDiff and LV	word

Thorlabs Confidential Page 203 of 234

	OUT YDiff). In addition, they can also be routed to the	
	TCH002 hub, which eliminates the need for external	
	SMA to SMA cables. This parameter is used to set the	
	LV Out signal routing as follows:	
	1 SMA Only	
	2 SMA + Hub	
OpenLoopPosDemands	When the Quad Detector T-Cube is operated in 'open	word
	loop' mode, the position demand signals (on the	
	XDIFF and YDIFF connectors) can either be set to	
	zero, or held at their last closed loop value, according	
	to the value entered in this parameter as follows:	
	set to zero (0V).	
	2 OpenLoopPosDemandsHeld = the outputs	
	are fixed at the values present when the unit	
	is switched to open loop.	
XPosDemandFBSense	Due to the choice of piezo amplifier/driver or the	short
	configuration of mirrors (or other optical	
	components) it is possible that certain application set	
	ups may require the sense of the X and Y axis	
	position demand signals to be inverted. This	
	parameter sets the signal sense and gain for the X	
	axis output as follows:	
	If XPosDemandFBSense is set to '10' (32767) the	
	signals are positive when the beam is in the left hand	
	quadrants of the detector array, and negative when	
	in the right hand quadrants. The gain of the system is	
	set to '1'.	
	If XPosDemandFBSense is set to '-7' (-22938) the	
	, ,	
	signals are positive when the beam is in the right	
	hand quadrants of the detector array, and negative	
	when in the left hand quadrants. The gain of the	
	system is set to '0.7'.	
YPosDemandFBSense	Similarly to the XPosDemandFBSense described	short
	above, this parameter sets the signal sense and gain	
	for the Y axis output as follows:	
	If YPosDemandFBSense is set to '10' (32767) the	
	signals are positive when the beam is in the top	
	quadrants of the detector array, and negative when	
	in the bottom quadrants. The gain of the system is	
	set to '1'.	
	If YPosDemandFBSense is set to '-3' (-9830) the	
	signals are positive when the beam is in the bottom	
	quadrants of the detector array, and negative when	
	in the top quadrants. The gain of the system is set to	
	'0.3'.	
	0.5.

MGMSG_QUAD_REQ_STATUSUPDATE MGMSG_QUAD_GET_STATUSUPDATE

0x0880 0x0881

Function:

This function is used in applications where spontaneous status messages (i.e. messages sent using the START_STATUSUPDATES

command) must be avoided.

Status update messages contain information about the position and status of the controller (for example position and O/P voltage). The response will be sent by the controller each time the function is

requested.

REQUEST:

Command structure (6 bytes):

0	1	2	3	4	5				
	header only								
80	08	00	00	d	S				

GET:

Status update messages are received with the following format:-

Response structure (20 bytes)

6 byte header followed by 14 byte data packet as follows:

0	1	2	3	4	5	6	7	8	9	10	11	12	13
		hea	ıder				Data						
81	08	0E	00	d	S	XE	iff	YD	iff	Su	ım	XF	os

14	14 15		17	18	19			
	header only							
YPos Status Bits								

Data Structure:

field	description	format
XDiff	The present X axis difference (XDIFF) signal from the	short
	detector head. (-10V to 10V in the range -32768 to 32767)	
YDiff	The present Y axis difference (XDIFF) signal from the	short
	detector head. (-10V to 10V in the range -32768 to 32767)	
Sum	The present Sum signal value from the detector head	word
	(0V to 10V in the range 0 to 65535)	
XPos	The X axis position output value -10 V to 10 V (i.e32768 to	short
	32767)	
YPos	The Y axis position output value -10 V to 10 V (i.e32768 to	short
	32767)	
StatusBits	The individual bits (flags) of the 32 bit integer value are	dword
	described in the following table	

Thorlabs Confidential Page 211 of 234

TQD001 controller Status Bits

Hex Value	Bit Number	Description
0x0000001	1	Position Monitoring Mode (1 - enabled, 0 - disabled).
0x00000002	2	Open Loop Operating Mode (1 - enabled, 0 – disabled)
0x00000004	3	Closed Loop Operating Mode (1 - enabled, 0 – disabled)
0x00000008	4 to 32	For Future Use

Example

RX 81, 08, 0E, 00, 81, 50, FF, 3F, FF, 3F, FF, 7F, 00, 00, 00, 00

Header: 81, 08, 0E, 00, 81, 50: QUAD_Get_StatusUpdate, 14 byte data packet, Generic USB

Device.

XDiff:.FF, 3F: 0x3FFF (16383 decimal), i.e. 5 V. *YDiff*:. FF, 3F: 0x3FFF (16383 decimal), i.e. 5 V.

Sum: FF, FF: (65535 decimal), i.e. 10 V.

XPos: 00, 00 i.e. Zero *YPos*: 00, 00 i.e. Zero

StatusBits: 04,00,00,00, i.e. 100 Closed Loop operating mode is enabled.

Thorlabs Confidential Page 212 of 234

MGMSG_QUAD_SET_EEPROMPARAMS

0x0875

Function: Used to save the parameter settings for the TQD001 unit. These

settings may have been altered either through the various method calls or through user interaction with the GUI (specifically, by

clicking on the 'Settings' button found in the lower right hand corner

of the user interface).

SET:

Command structure (8 bytes)

6 byte header followed by 2 byte data packet as follows:

0	1	2	3	4	5	6	7
header						Do	ıta
75	08	02	00	d	S	SubN	1sgID

Data Structure:

field	description	format
SubMsgID	For future use	word

Example:

TX 75, 08, 02, 00, D0, 01, 00, 00,

Header: E7, 07, 04, 00, D0, 01: Set_EEPROMPARAMS, 02 byte data packet, Generic USB Device.
